satisfactory. The time occupied in preparing concentrates by the new process is one and one-half to two hours, the old roasting stage being done away with.

In the Carmichael-Bradford process the use of gypsum is the chief factor. The process is as follows: The gypsum is first dehydrated—turned into what is really plaster of paris. It is then well mixed with the sulphide concentrates (or slimes), the percentage of gypsum used being about 20%. Next, water is added, and when the mixture is thorough it is set out to dry, crushed small to an average size of $1\frac{1}{2}$ to $\frac{3}{4}$ inch. The dust is sieved out and set aside to be again mixed. After being crushed the mass is ready for the converter, which, in the experiments, has been of cast iron. The size of the converter used was 3 feet 9 inches across the top and 3 feet 1 inch deep, V-shaped. The bottom plate is well covered with red-hot coal, of equal redness all over to a depth of 2 inches. The pot is filled with the rough mixture—the rougher at the bottom and the finest on top—a hood is placed on the top and $\frac{1}{2}$ ounce of air turned on. After a quarter of an hour the air current is increased to $2\frac{1}{2}$ to 3 ounces, which is kept going until the pot is cooked. The pot used in the experiments contained 12 cwt., and the average time occupied in a thorough cooking was one and one-half to two hours. Slimes take no longer to treat than concentrates.

The loss in the Carmichael-Bradford treatment is of silver nil and of lead 0.7%. In all the initial experiments the highest loss of lead was 0.7% and the lowest was 0.2%. Most of the sulphur is driven away. The highest residue of sulphur obtained in the experiments was 5%; in a number of assays only 1.5% was shown. It is desirable to allow some sulphur to remain in order to facilitate the smelting, so it will be advantageous to allow about 5% of sulphur to remain.

The secret of the process is in the use of the gypsum and the knowledge of the percentage necessary for the various concentrates and the proportional sizes of the machinery necessary for the charges. The machinery is simple—a converter and a blower, the latter of the ordinary type in every-day use. The air is conveyed into the converter from the bottom. When the process is used on a large scale various mechanical devices will be adopted for saving time and labor in respect of charging, tipping, clean-

Section of Engine Room, De Lamar Mill, De Lamar, Nevada.

sult has been the production of numerous brecciated ore zones which filled up the corners where the north and south dike has crossed the east and west dikes. Thus, to-day, these well-known ore shoots have been developed in six of these eight corners, and the other two corners give promise of producing equal results in the future. These ore bodies have evidently been mineralized through the openings at the corners where the dikes make their crossings, and the quartzite which had been broken into more or

ing and so on. The product is a rough, homogeneous mass. The difficulties stated to be overcome are incomplete desulphurization, loss of metals by volatilization and the fine condition of metals to be fed to the blast furnaces.

The process may prove valuable in the treatment of zincs. Further value may be derived in distilling sulphuric acid, as the sulphur from the pots can be liquefied and turned into the acid.

Lunkenheimer New Works.

The Lunkenheimer Co. of Cincinnati, Ohio, manufacturers of brass and iron goods and specialties for engines, boilers, etc., such as brass and iron valves,

The New Works of the Lunkenheimer Company.

whistles, injectors, lubricators, oil and grease cups, etc., on October 25th opened their new works to about 3000 visitors and have moved from their old quarters on Eighth street. The five buildings represent an investment of \$300,000. They occupy three acres of ground, three acres additional providing for future extension of the business. These factories are near Brighton station in a section of the city called Fairmount, within 2 miles of the center of the city.

A novel feature in the main building is the heating system, inasmuch as the hot air travels through the fourteen large hollow columns which support the floors around the area in the center of the building. These columns have openings on each floor to distribute the air; the bases of the columns are connected with a huge fan by means of tunnels under the basement floor. By this construction the usual galvanized iron air pipes are done away with and adds greatly to the simplicity of the building.

The foundry has overhead track system for carrying material, smelting furnaces burning crude oil and pneumatic appliances, such as are used in latest foundry practice.

The illumination is furnished by the Nernst lamp. Owing to the arrangement of the lamps, the distribution of the light is even and without shadows. The lamps are so arranged that sufficient illumination is secured without providing each operator with an individual light.

The office building is a three-story pressed brick structure 50x80 feet with modern equipment, the second floor being occupied by the draughting and engineering departments and the third by advertising department, as well as a laboratory and photograph gallery. The business was founded in 1862 by the late Frederick Lunkenheimer and has grown to large proportions, now employing over 700 men. With increased facilities the company expect to extend their line and take up many new engineering specialties. The company's trade is domestic and foreign, being distributed largely through jobbers. They also have a branch store in London, England, and an office in New York City. The company have placed many orders for additional tools and machinery, which are being installed in their new quarters.

Pyritic Smelting of Gold.

In a paper recently read before the Engineers' Society of Western Pennsylvania, W. F. Koch claims that sulphur, so far from being a deleterious ingredient, may often be a positive advantage if the older methods of treating such ores are abandoned, and the gold is obtained by pyritic smelting. In this case the sulphur, instead of being wasted by roasting it off, serves as fuel, replacing an equivalent quantity of coke. The ores charged into the furnace are quartz ores, lime ores, quartz and lime ores, quartz and aluminous ores, all containing gold in varying amounts and a small percentage of copper. Mixed with these are the pyritic ores, ranging from pyrites to pyrites with quartz, quartz with pyrites, lime and pyrites, and quartz, lime, alumina and pyrites, which form a fairly representative list of refractory gold ores. The furnace used is a simple water-jacketed

blast furnace, having provision for collecting the waste heat which is utilized for warming the blast. This blast should be just powerful enough to get a hot zone right at the tuyeres, a greater supply of air being a disadvantage, since there is then a tendency to set up reactions in the descending column of ore and fuel. For similar reasons the height of ore above the tuyeres should not be too great. The charge consists of a mixture, in the following proportions of ores, such as those already mentioned: Pyrites 15%, quartz ores 45% (these usually contain lime and pyrites), lime ores 20%, low grade matte 10%, slag 5%, coke 5% to 3%, and from 1% to 2% of charcoal, which costs at the furnace in question about half the price of coke. The charge of fuel added is thus about 5% of the total.

While the furnace is at work slag is run off continuously, while the matte which contains all the gold, silver and copper in the original charge is tapped out from the bottom of the furnace as required. When the copper contents of such matte amount to 45% it is standard, and can be sold to the large copper refiners, who will extract from it the gold and silver. If this standard is not reached the matte is passed again through the furnace till it is enriched to the necessary degree. The slag contains only traces of gold and silver and is thrown away. A complete plant, capable of treating ten tons of ore per day, and yielding three to four tons of standard matte, costs, it is stated, but a couple of thousand pounds, and stamp mills are not required, since it is unnecessary to pulverize the ores before passing them into the furnace. Mr. Koch holds that this method it likely to take a great development in the future, and will, with the cyanide process, be responsible for a large proportion of the world's output of gold. He thinks that the process of extraction by chlorination will, on the other hand, tend to disappear, as it is only suitable when ores free from lime and water, also lime free, are both available, though at Cripple Creek this method is so far the favorite.

Blue Printing by Electricity.

Time was when the familiar "blue print" could

Cylinder in Horizontal Position for Inserting or Removing Tracings or Paper.

only be produced by sunlight, but advancing science enables one now to dispense with sunlight and make

blue prints regardless of time or weather. Herewith is partially illustrated an apparatus for such work, which consists of a cylindrical printing frame, composed of two heavy curved plates of glass, bedded in soft material in an adjustable, though rigid frame, together with two tubular uprights which support the arc lamp and automatic drive mechanism. This drive operates the lamp, having means for lowering it through the cylinder and then automatically raising it again to its former position. The cylindrical frame revolves on trunnions, so that it can be swung to a horizontal position, which is the most convenient method for inserting or removing tracings and paper from the frame.

In operating, the cylinder is revolved to a horizontal position, and the tracings and sensitized paper are placed around the outside of the cylinder, being confined by stout canvas covers, which are drawn tight by turning a lever, thus insuring perfect contact between tracings, sensitized paper and glass. The cylinder is then swung to the opposite horizontal position and the same manipulation repeated, after which it is returned and locked in vertical position and is ready for printing. By simply touching a lever the arc lamp starts in its descent through the center of the cylinder at a speed which can be regulated to suit the sensitiveness of paper employed. When the lamp has reached the lowest point of printing surface, it automatically reverses its motion and quickly returns to its original position above the cylinder.

The device is manufactured by Eugene Dietzgen Co., 181 Monroe street, Chicago, Ill.; 119-121 Twenty-third street, New York City; 508 Market street, San Francisco, Cal.

Notes on the Estimation of Copper by Potassium Permanganate.

H. A. Guess, in the Jour. Am. Chem. Soc., describes a modification of the ordinary thiocyanate method of estimating copper in ores, tailings and concentrates, doing away with asbestos filtering material, and using filter paper well extracted with hydrochloric and hydrofluoric acids instead. The author describes the exact process as follows:

From one to five grams, depending on the material for assay, are digested in an eight-ounce flask with nitric and hydrochloric acids, together with a few drops of sulphuric acid, to get rid of any lead present, the excess of acid is boiled away, the acid solution diluted, filtered and the residue well washed on the filter. The acid filtrate is neutralized with ammonia and then rendered just acid by a few drops of dilute hydrochloric acid. The acid cupric solution is reduced by an excess of sodium sulphate, or sulphurous acid, previously nearly neutralized by sodium carbonate, and the copper precipitated as white granular cuprous thiocyanate by a slight excess of potassium or ammonium thiocyanate. The mixture is heated to boiling, the precipitate settling rapidly. The clear supernatant liquid is decanted through an eleven cm. filter, and the residue, after washing by decantation, is finally washed with hot water. The funnel, with its filter and precipitate, is now placed in the original precipitation flask, and a boiling 10% solution of caustic soda poured through. The operation is repeated with a further amount of the caustic soda solution, the filter being filled each time to insure complete contact with all the precipitate. Complete decomposition of the cuprous thiocyanate takes place, the equation being $\text{CuCNS} + \text{NaOH} = \text{CuOH} + \text{NaCNS}$. The insoluble yellow cuprous hydroxide remains on the filter, the alkaline thiocyanate passing through. The filter and contents are well washed with hot water, the alkaline filtrate made decidedly acid with dilute sulphuric acid and the liberated thiocyanic acid titrated with standard potassium permanganate at the warm temperature given it by the hot water washing. The chief imperfection of this method lies in the slight solubility of cuprous thiocyanate in the solutions present.

The theoretical conversion factor for the permanganate from iron to copper is 0.1892, while its value as actually found by standardizing the permanganate solution against a weighed amount of copper, by this method, was .1920 of the iron value of the permanganate solution. This difference is due to the slight solubility of the cuprous thiocyanate and the consequent incomplete precipitation.

By standardizing the permanganate solution always against pure copper, under same conditions as the regular assays, this error of solubility is, for all the technical purposes, eliminated. The slight action of the hot caustic alkali solution is another imperfection of the method. This error is constant for the same kind of filter. A blank must be run for this correction. The author finds that on an eleven cm. filter it amounts usually to 0.3 c.c. potassium permanganate, of a strength of 1 c.c. = 2 milligrams copper.

The author states that this method is more accurate than, and distinctly superior to, either the iodide or cyanide method for small or fractional percentages of copper.

Mining and Metallurgical Patents.

Patents Issued November 4, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ACETYLENE GAS GENERATOR.—No. 712,474; D. Barnard, Bakersfield, Cal.

In gas apparatus, combination with gasometer having movable member, provided with upright stem having offset stop intermediate its ends, of generating chamber, carbide reservoir having communication with generating chamber, valve controlling communication, provided with stem that projects above reservoir, lever pivoted at one end and attached at intermediate point to valve stem, free end of lever bearing against stop, pulley journaled upon stem above stop, flexible cord or cable secured to free end of lever, passing over pulley and weight attached to free end of cord or cable.

MUFFLE FURNACE.—No. 712,502; Convers and De Saulles, South Bethlehem, Pa.

Retort furnace provided with two retort chambers or compartments having gas and air inlet flues at bases, having central downtake, air-distributing chambers for air inlets, gas distributing chambers for gas inlets, air-regenerator chambers supplying air-distributing chambers, horizontal flue for waste products of combustion communicating with central downtake, located between gas distributing chambers, horizontal flue communicating with heating flues of air-regenerator chambers.

HOISTING HOOK FOR MINERS.—No. 712,959, C. F. Pohlman, Spokane, Wash.

Device of class set forth comprising pair of jaws pivotally connected at upper terminals having lower interlocked hooked terminals freely movable in relation to each other, shoulders on outer edges above the hooked terminals, shoulders having combined transverse extent greater than combined overlapped extent of jaws at distance below shoulders, a link embracing jaws freely slidable over latter, link being normally loosely located below shoulder but having greater length than distance between outer terminals of shoulders when jaws are closed.

ROCK DRILL.—No. 712,592, J. Puechagut, Black Diamond, Wash.

In device of character described, spindle, nut threaded thereon, multiple gear wheel journaled on trunnion of nut, second gear wheel mounted on spindle, splines located within grooves of spindle, second-named gear wheel, friction rolls on splines bearing against sides of grooves of spindle and end of nut, yoke connecting splines, spring carried thereby to engage any one of several notches in hub of second-named gear wheel whereby gear wheel is adjusted in its position with relation to nut, so as to mesh with one or another of series of teeth on multiple gear wheel.

ORE FURNACE.—No. 712,812; W. A. Koneman, London, England.

In an ore furnace, combination of vertical combustion chamber divided by horizontal baffles into passages each opening into that immediately above it, whereby products of combustion in rising through chamber traverse in succession all passages and whole length of each passage, vertical exhaust chamber, walls spaced apart to afford combustion, exhaust chambers formed with half-brick sections each provided on one side with V-shaped recess, recessed surfaces facing each other, forming ports p, and one chamber between walls provided with feed inlet at upper end with discharge outlet at its base.

FURNACE.—No. 712,636; C. S. Batchelder, Spokane, Wash.

A muffle furnace for purpose stated, comprising

metallic casing, lining of refractory material, asbestos packing interposed between metallic casing and refractory lining, solid fuel burning firebox having lateral stoking opening, firebox and opening being located in base of furnace, plurality of muffle chambers in vertical alignment with firebox, contractions between muffle chambers, and doors for muffle chambers arranged to admit air thereto.

VALVELESS ENGINE FOR DRILLS.—No. 712,597; R. L. Rickman, Denver, Colo.

In valveless drill, cylinder having suitable inlet, admission and exhaust ports, piston having reduced central portion adapted to control ports, ratchet ring located upon reduced central portion, corresponding spiral ribs and grooves on inner wall of ring and on piston, pawl engaging ratchet, whereby piston is reciprocated and is intermittently rotated. In combination, piston A having grooves 24 thereon, ratchet 20 having ribs 23, pawls 25, 26 in connection with ratchet, and means for reciprocating piston.

DEVICE FOR OPERATING CONCENTRATING TABLES.—No. 712,934, A. W. Johnson, Aspen, Colo.

Device for converting rotary motion into reciprocating motion, comprising crank shaft, connecting rod, rocking arm connected thereto, fulcrumed at lower end, having projection above its fulcrum, yoke made in one piece embracing rocking arm having seat with three bearings, and thrust block for connecting any one of bearings to projection of rocking arm, one end of yoke being extended in form of stem and bearing compression spring, vertical abutment bar for spring receiving and guiding stem, two parallel anchorage rods for abutment bar connected to it.

PROCESS OF TREATING ANODE RESIDUES.—No. 712,640; A. G. Betts, Troy, N. Y.

Process of treating anode residues containing lead, copper, antimony and arsenic from the electrolytic refining of lead alloy, which consists in combining part of the lead, copper, antimony and arsenic present with chlorine gas, of removing them as chlorides in solution and of distilling off the water, antimonious and arsenious chlorides from solution.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

(Special Nome Correspondence).—Operations on the creeks are suspended; the season was very satisfactory, freezing weather commenced only to-day. Sluicing was done on many creeks in the Nome district up to the 18th, the working season actually lasting from June 15 up to October 19. The very dry weather was somewhat counter-balanced by the new ditch system that has been inaugurated this season, and the next season will be in all probability a still greater activity in the construction of ditch systems on the whole peninsula.

The result of this summer season's work is variously estimated at from \$6,000,000 to \$7,000,000. A carefully prepared table of the estimated output by creeks and districts is as follows:

Nome District:	
Anvil creek and benches.....	\$1,250,000
Glacier creek and benches.....	500,000
Dexter creek and benches.....	550,000
Rock creek and benches.....	75,000
Oregon creek and benches.....	50,000
Buster creek and benches.....	25,000
Nome river and all other tributaries.....	55,000
Bourbon.....	65,000
Dry creek and tributaries.....	75,000
Cooper's gulch.....	15,000
Bangor and Boulder.....	12,000
Wonder, Holyoke and Saturday.....	25,000
Peeluk creek.....	35,000
Otter creek.....	45,000
Solomon river.....	75,000
Big Hurrah.....	75,000
Kasson creek.....	100,000
Shovel creek.....	10,000
West creek.....	5,000
Mystery creek.....	35,000
Small creeks.....	250,000
Nome beach.....	200,000
Council District:	
Ophir creek and tributaries.....	1,500,000
Cassa de Pago and tributaries.....	75,000
Top Kock.....	150,000
Spruce creek.....	15,000
Small creeks.....	100,000
Kougrock and Fairhaven Districts:	
Kougrock and tributaries.....	\$ 45,000
Immatchuk.....	75,000
Candle creek.....	150,000
Iron creek.....	45,000
Gold Run.....	75,000
Small creeks.....	45,000

Total.....\$5,802,000

Winter work will be very extensive the coming season. Preparations are made to open up benches on Peeluk and Otter creeks, which have shown up some very good prospects. It appears from the discovery of No. 3 Peeluk creek, that the beach extended at an earlier period much farther inland and deposited beach pay parallel to the present shore line on the high benches and tundra, the pay having been traced for a considerable distance east of Nome, and the probabilities are that very good results will be obtained from the winter's operations.

Some good paying creeks have been discovered at the St. Lawrence bay, Siberia. The Mining & Trading Co. holding the concession from the Czar is under very heavy expense, and success and encouragement in opening up the vast undeveloped country should be what they deserve. Before close of navigation I shall write one more letter.

Nome, Oct. 20.

Director of the Mint Roberts makes public final statement of the gold output of Alaska for the last ten months. These figures, based on the receipts at San Francisco, Seattle and the Selby refinery, show a total of \$18,870,075, as follows: Klondike (Canadian), \$13,861,095; Nome, \$5,008,980. The total is over \$4,000,000 in excess of the Alaskan output for the entire calendar year 1901, the figures for that year being \$14,675,675. In the output for the last ten months is included \$250,000 expected to arrive from the Klondike before January 1, and \$1,350,000 expected from Nome.

ARIZONA.

COCHISE COUNTY.

The Black Diamond Copper Co., 12 miles from Pearce, are preparing to blow in their 100-ton smelter.

The Calumet smelters at Douglas are being completed. Superintendent Merrill says: "We will blow in by Nov. 10th."

In the vicinity of Bisbee the Copper Queen is putting out copper bullion and pushing development and prospecting work.—The Calumet & Arizona Co. is getting ready to transport ore to its reduction works at Douglas.—The Calumet & Pittsburg is sinking its shaft.—At the Solomon Springs Copper Co.

Superintendent Palmer is pushing development work.

GILA COUNTY.

Troy reports a heavy flow of water in the Alice shaft. The ore body on the second level of the west drift of the Alice has improved greatly—carbonate and glance. The black sulphide ore in the second level of the Sisson continues to improve. The electric hoist at the Buckeye mine is in operation.

GRAHAM COUNTY.

Near Safford Superintendent Stafford continues in charge of the Horseshoe & Gila Valley property, which has been transferred to a new organization, the Federal Mining Co.

Eighteen miles from Pima, J. D. McEnery has sold the Kin-e-chy group of twenty mining claims to Detroit, Mich., men, who will organize a company and commence work on the property within three months.

Six new converters have arrived at Clifton for the Arizona Copper Co.

The Federal M. Co. has been organized to work mines in the Lone Star district, headquarters at Safford. Its property consists of the San Juan and Great Eastern groups of mines. Its incorporation absorbs the Gila Valley Copper Co. and the Horseshoe Copper M. Co. The members of the company are New York people. J. M. McCollum is the local representative of the company.

MOHAVE COUNTY.

At Todd Basin Superintendent J. D. McNab will put a 50-ton mill on the Oro Plata mine.

At the Gold Road mines Superintendent Stevens has 100 men at work.

J. W. Morgan, superintendent Golden Gem mine, Cerbat, tells the Kingman Miner that the mine shows good ore in the lower levels and that, when a reduction plant is installed, there will be enough ore to keep it running.

The mines of San Francisco mining district are increasing their force. The Gold Road mine is now employing 120 men and the Leland has 28 miners on the payroll. The other mines have doubled their forces during the past month and are employing all who apply for work. The Gold Road Co. is working on the new wagon road over the mountain from Little Meadows; another force is laying pipe and erecting buildings at the foot of the mountain.

North of the Colorado river the various mining companies are arranging for an active winter's work. The leaching plant in the Buckskin mountains is doing good work; the company is figuring on an extension of the plant. The Grand Gulch people are opening the mine below the 400 level. The permanent formation has not been reached in any of the mines. The ore bodies lie in the sandstone in large deposits and have little connection with each other.

PINAL COUNTY.

The Republican says that the Arizona Copper Mountain M. Co., near the Gila river, 6 miles from Kelvin, has determined to erect a plant for the reduction of the copper ore which has been developed in the Copper Butte. The railroad line is a mile from the main workings of the company.

SANTA CRUZ COUNTY.

At Oro Blanco the Old Glory stamp mill is in working order for Brand & Ish, who have bonded the mines and mill. The ore is taken from the Old Pedro Pellon mines. Fifteen men are working in the mine night and day. In the 60-foot shaft they have 4 feet of ore which runs from \$15 to \$75 per ton gold. The only drawback is lack of water; there has been but little rainfall in that section and the mill dam has about enough to run a month. The water is being saved as it is carried back again into the dam after being used in the mill.

YAVAPAI COUNTY.

Patenting of the Verde Queen group of twenty-eight claims is completed. The property is equipped with a 30-ton smelter, which has turned out sixty tons of bullion during its operation. The property is reported sold for \$250,000 through the efforts of J. A. King, who for two years was superintendent. The old company was composed mostly of New York people. Through this sale the Verde Queen becomes the property of Massachusetts men. Prospect work on the Verde Queen shows one ore body 300 feet long, 60 feet in width, which samples 4% copper. It is the intention of the new company to do extensive development work.

Jerome reports that preparations are nearly completed for starting the United Verde smelter. On the 15th two of the six furnaces will be blown in. W. A. Clark, the owner, ordered this smelter closed ninety days ago, and has put in the time enlarging the smelting plant. Before the shut-down the smelter handled 1200 tons of raw copper ore every twenty-four hours. Four of the 200-ton furnaces

have been taken out and replaced with 500-ton furnaces. The increase in capacity will now permit the handling of 2500 tons of raw ore. The run of the mine is about 8% copper, which makes the output of copper from Jerome about 200 tons every twenty-four hours.

Last Saturday, says the Prescott Courier, two men went down the shaft of the Little Jessie mine to figure on a contract. When they reached the 500-foot level they were caved on. One of the men, named Pickering, was pinned down in some water and drowned. The other man was seriously, if not fatally, injured. He is now being cared for at the McCabe hospital.

YUMA COUNTY.

A company composed of San Francisco, Los Angeles and Arizona men is being organized to work the Gila City placer grounds. These gold fields have been worked in recent years by Mexicans and Indians, who can make \$1 a day panning gold, but are now almost exhausted for working in a small way, and the new company proposes to work them on such a large scale as to extract the gold at a minimum expense. They propose to take water from the Gila river and pipe it from a reservoir to the fields.

CALIFORNIA.

AMADOR COUNTY.

W. T. Beatty has bonded the Alpine mine at Plymouth. The Alpine adjoins the Empire mine, has two shafts, one 700 feet, the other 600 feet in depth. The 600-foot shaft will probably be the first one opened up.

The new 10-stamp mill at the Defender mine, Pioneer district, started on October 15. The Ledger says after a short run it was found that the mortar blocks, made of cement, gave way, and the mill had to be shut down. The cause of the blocks crumbling was improper mixing of material.

The Kennedy new hoist is delayed, material not having arrived.

CALAVERAS COUNTY.

At Hodson the Royal mine is a good low-grade proposition, and with its 40-stamp mill has proved profitable. Out of 365 days, the 40-stamp mill was running 362. Graders are at work for a new 120-stamp mill to be erected soon. A rock breaker of sufficient capacity to supply the 240 stamps will form a part of the new works. Fifty men are employed on the grading. Each battery of ten stamps will be operated by a separate motor. It is expected that when the new mill is in operation the cost of mining and milling the ore from the mine will be reduced below 80 cents a ton.

The Wilbur-Womble Co., adjoining, is putting up large works.

EL DORADO COUNTY.

J. H. Batcher of Sacramento is vice-president Twin Brothers' M. Co. The mine is situated near Salmon Falls. A contract has been let to run a 350-foot tunnel; a 15-stamp mill is to be put in.

At the Zimmerman gravel mine the compressors afford power to work eight drills. Twenty-three men are at work at the mine grading roads and sites.

INYO COUNTY.

Ballarat says: "There is nothing about the story of a niter excitement here, nor are there any teams with prospectors on their way to the niter beds in Death valley."

J. S. Stotler has bought from H. E. Finley of Ballarat a half interest for \$5000 in a gold and lead claim in Rising Springs mining district, in the Funeral range of mountains. The new purchaser will put men to work taking out ore.

KERN COUNTY.

The Randsburg Miner says Hough, Balchweid & Boydston are working the Pearl Wedge, are down 140 feet, and have a ledge of ore 18 inches in width which shows \$75 per ton.

The cleanup at the Red Dog mill from 80.75 tons of ore from the Butte mine resulted in three bars worth \$5824, average \$72 a ton. A check for \$4607 was also paid to the Butte Co. by the same milling company as a result of the treatment of 680 tons of tailings, recently cyanided, representing a gross total production of the Butte mine for October of \$10,431. The increase in production of the ten months of 1902 over the corresponding ten months of 1901 is \$14,636.52. Sinking another shaft of 100 feet was resumed. This will make the depth of that shaft 525 feet.

The price of oil at Bakersfield is 18 cents per barrel.

A new deposit of fuller's earth has been discovered in San Emidio mining district, 35 miles from Bakersfield.

LOS ANGELES COUNTY.

The merger of the Edison Electric Co., Redlands Electric Light & Power Co., Pasadena Electric Light & Power Co., Santa Ana Gas & Electric Co. and other

subsidiary companies of the Edison Electric Co. will be known as the Edison Electric Co. Among the projects under way are the construction of a 20,000 H. P. water plant on the Kern river, a 3000 H. P. water plant on Mill creek and a 3000 H. P. steam plant in Los Angeles.

MADERA COUNTY.

The Los Angeles Mining Review learns that at the Alpha mine Superintendent Cummings has sixteen men at work.—J. T. McClellan, superintendent of the Texas Flat group, has graded for a 20-stamp mill. This company has a 3-mile water pipe line.

MARIPOSA COUNTY.

Eighteen mining claim locations in the Coulterville district were recorded in October.

NEVADA COUNTY.

Superintendent H. G. Murray, at Meadow Lake, is developing the property. E. Deacon is foreman of the only mill running in the Meadow Lake mining district and has good returns.

The Sierra Queen M. Co. will sink to the 500 level. The mill at present is not running.

Superintendent W. H. Bray of the Posey mine, owned by the Posey Con. M. Co., has the shaft down 350 feet, and for the past 50 feet ore going \$100 per ton has been taken out. The ledge is 1 foot wide and carries free gold.

A shaft will be sunk on the Gold Blossom.

At the Rose Hill mine, on Winchester hill, tributaries have put a lot of stull dirt from the mine through the Southern mill, realizing \$60 per load on it.

The Pennsylvania Co. has fifty-three men working in the mine.

PLACER COUNTY.

A cleanup of twenty-one tons from Johnson's Last Chance mine at Ophir returned \$23 to the ton.

J. A. Hill, on Rock creek, has made a crushing of a ton of ore that netted him \$1000.

Superintendent J. Waggoner of the Bonnie Bee mine has the tunnel in 400 feet; 2000 tons of ore are on the dump; five stamps will be set up; in the spring another five will be added.

The air compressor for the Mountain Maid mine at Chicago Park is in position. It weighs 15,000 pounds.

SAN DIEGO COUNTY.

F. A. Aces of Los Angeles is appointed receiver of the mine in Rancho Rincon del Diablo in a suit for foreclosure on the mine on the ground that the terms of the contract were not fulfilled. According to the contract the mine was sold to S. M. Green of Milwaukee for \$100,000; \$75,000 was to be paid down, \$5000 was to be paid at the end of four months, and the remaining indebtedness was to be paid in \$5000 installments every two months. Green paid the \$75,000 and the first \$5000, but neglected to pay the balance of \$20,000.

SANTA CLARA COUNTY.

R. B. Harper, superintendent of the Santa Teresa quicksilver mine on the Monterey road, reports an ore bed that justifies the erection of a forty-ton furnace. The strike was made 300 feet from the surface.

SHASTA COUNTY.

In the Balaklala mining case the decision is in favor of the Balaklala M. Co., against Madden, Murray, Conroy and Grotefend. A decree was made last Saturday for the sale of the property and the payment to Murray and Conroy what is due them on the original purchase price of the mine. The case was taken into court on a suit for partition. Murray and Conroy claimed an interest in the property and Grotefend claimed a judgment lien on the mine. The court found that Murray and Conroy have no interest in the property except a balance of \$2700 on account of the purchase price.

Manager W. A. Hall of the Brandy Creek W., L. & P. Co. says he will begin work at once on the \$200,000 enterprise of supplying Redding and Keswick with gravity water from Brandy creek.

The Northern California Electric Power Co. says it will have its poles up and wires stretched into Winthrop this year. There are fifty men working on the line.

The Mountain Copper Co. has the fire in the Iron Mountain mine under control. A 60-inch main, 2 miles in length, has been connected with the mine and the lower workings where the fire was raging is completely flooded.

The Bully Hill reports 7 feet of ore showing forty ounces silver, \$6 gold and 6% copper.

The Searchlight notes that work at the Shasta King mine of the Trinity Copper Co. is being apparently suspended gradually. The air compressor and diamond drills have been closed. The force has been reduced; there are about twenty men now employed by the company,

mostly in the mine. The Shasta King mine is west of Kennet in the Backbone district. It is owned by the company named, at the head of which is T. W. Lawson. A. H. Brown, former superintendent Bully Hill property, is in charge of operations at the Shasta King.

The Redding C. & G. Co. has a year's bond on the Roid mine, \$10,000, and a bond of \$6000 for fourteen months on the La Plant group.

SISKIYOU COUNTY.

Wadsworth & Barton, with placer ground consisting of 665 acres comprising 5 miles of Beaver creek and 4 miles of the Klamath river, propose to dig a 10-mile ditch, capacity 8000 inches of water, to cover these properties. Capital required, \$200,000. In Klamath river placer mines, from an estimate of different mines worked from Virginia bar to Horse creek, by wing damming and the working of the river bars, from a total of 535,176 cubic yards of gravel \$971,158 was realized. This includes all the ground worked in the mines from the surface down.

TRINITY COUNTY.

Superintendent G. Day of the Enterprise will retimer the upper tunnel. This tunnel is in 226 feet. Three shifts will work in the lower tunnel. This drift has been advanced 1100 feet on the lead and opens up a body of high-grade gold ore.

Manley & Woodlin have bonded the Enterprise group of mines, on the east fork of Trinity river, 25 miles from Weaverville. A 10-stamp mill, perpetual water right and all necessary buildings for the operation of the mines are included in the deal. M. Manley says he will be the manager and will double the capacity of the mill plant and increase the force of men now at work. A. L. McLean will assist him in the management of the property. The mill will be in charge of J. F. Stevens.

TUOLUMNE COUNTY.

(Special Correspondence).—At the Spring Gulch mine crosscuts are being run into the hanging wall on the third and fifth levels to the hanging wall vein, which has been proved in the upper workings.—For the projected Yosemite Railroad from Chinese Camp preliminary surveys have been made by J. G. Hopper and a grade established to the level of the Tuolumne river via Woods creek.

Near Columbia the Springfield Tunnel Co. have struck a channel in the north incline at a depth of 350 feet.

In the Leap Year gravel mine, 2 miles west of Jamestown, there is 4 feet of pay gravel in the face of the tunnel.

The Sonora Independent says, at the Mt. Hood or Rawhide Extension G. M. Co. the mill is completed and the machinery is being put in. At the Toledo mine the shaft is sunk 300 feet and still going down. The vein is the full width of the shaft; sulphurets exceedingly high grade; some free gold shows. At the Rawhide timbering generally in the mine goes on. The Clio at Jacksonville has the mill running on full time with oil as fuel.

In the Dutch mine a winze 112 feet from the 1200 to the 1300 is finished. The shaft is down 100 feet below the 1300-foot level. The angle of the shaft is 68. A drift has been run south of the shaft 360 feet. The mill is crushing on full time. This is almost the only mill running in that vicinity, owing to the fact of oil being used for fuel. The new boiler is all set with oil connections and burners; capacity 95 actual H. P. A 2000-foot new steel Roebeling cable 1 inch in diameter has been delivered at the mine.

At the Harvard G. M. Co. No. 1 shaft is timbered to the 700-foot level; sinking will proceed.

The Dreisam at Arastraville will resume shaft sinking.

At the App the mill, machinery and power-water pipe are being overhauled.

The Tuolumne W. & E. P. Co. will resume operations at the Phoenix lake power house November 15. All the big mines in the county will resume operations next week. At the Eagle-Shawmut mine the new 100-stamp mill is in readiness and will be started up next Thursday with water for power. A full force of miners will be put on.

YUBA COUNTY.

Work has begun on debris barrier No. 1 at Daguerre Point, on the Yuba river, below Smartsville.

COLORADO.

BOULDER COUNTY.

Near Eldora, the Tungsten M. & M. Co.'s shaft has been sunk 90 feet. The formation is a peculiar one, two distinct ore bodies lay side by side. On the foot wall and for about 4 feet above is found a body of wolframite, rich in tungstic acid. Above this lies a body of sulphide ore carrying gold, silver and copper. Of the wolframite, the Primos Chemical Co. of Primos, Pa., says in a letter to Manager H. T. Coates: "We have just finished the

analysis of samples sent us and find them to contain 69.98% of tungstic acid. Ores that contain 65% to 72% tungstic acid are classed as high-grade ores. We are in the market for all we can get of this class of ore and will be glad to quote you prices when you are ready to ship."

CHAFFEE COUNTY.

The Magenta mill at Granite has started, treating ore of the Washington mine.

CLEAR CREEK COUNTY.

Near Silver Plume the reopening of the Atlantic-Pacific tunnel, once known as Brick Pomeroy's great bore through the continental divide, is looked for. The tunnel has attained a length of over 1 mile on the Atlantic slope, through the Argentine gold belt, at a depth of 2000 feet under the apex of Kelso mountain.

R. A. Hall, who proposes to construct a railroad through the Idaho Springs mining district from Central City to Yankee, says he has the greater portion of the necessary funds guaranteed and intends to push the project forward.

The sale of the mines on the Gem, which was noted in last week's issue, and consolidation of the different mines on Seaton mountain, with 100 claims, into the Gem Consolidated Mines Co., means the handling of over 1000 tons of crude ore per day at the mills, and a heavy tonnage shipped direct to the smelters.

Manager B. C. Catrena of the Terrible group of mines at Silver Plume will spend \$50,000 in putting in machinery and development work.

The Red Elephant group of seventy claims on Red Elephant mountain at Lawson will have machinery equal to the Terrible.

The Prudential M., T. & T. Co. has elected W. C. Hood manager. The properties owned by the company are on Republican mountain, including nineteen recorded claims and in rights embraced within the Prudential and Montgomery-Ward tunnel sites, each of which controls an area 3000 feet square. The Prudential tunnel will be the main thoroughfare for developing all the territory at depth, and is projected to be driven 6000 feet in length, with laterals extended each side on the veins as they are cut. The first 3000 feet of the Prudential tunnel will intersect nearly all of the nineteen claims.

At Yankee Hill H. Preston is pushing work on the Chesapeake tunnel.—The new shaft on the Mary Murphy is completed.—Constant development work is being done on the Puritan.—The Hilton tunnel is being driven ahead.—B. F. Musgrove talks of a new 10-stamp custom mill.—The Ora Verde Co. has two shifts working with electric drills. There is a 4-foot body of ore.—The battery of the dry process mill may be enlarged.—As says from the Mack No. 2, east slope Yankee hill, show values of \$25.

The Marshall-Russell tunnel at Marshall park has cut the sixth blind lode. The vein was cut at a distance of 460 feet. It carries 8 feet of white quartz, with 3 feet of sulphide ores, averaging \$8. The property is being worked by water power from Clear creek. A steam plant is to be installed. While the trammers are working at the breast the air drills are used in the drifts, and vice versa. The vein cut by the tunnel two months ago has been drifted on for over 100 feet, the pay ore having opened up to a width of 10 feet.

Last Saturday, in the 1000-foot level of the Aliunde mine, workers on the Haggar & Co. lease on the Aliunde knocked down \$1000 worth of ore with two shots.

CUSTER COUNTY.

R. Irwin is working the Reveille mine at a depth of 107 feet, and has ore that runs an ounce in gold, thirty ounces silver, 20% lead. The Bassick mine shaft is down 1700 feet, and is producing ore that runs 60% gold to 40% silver. The company's mill will have to be removed to Westcliffe owing to scarcity of water at the mine where it is now located. When this is done the company will build its own railroad from the mine to Westcliffe, a distance of 10 miles, and the Rio Grande will equip and operate it.

The Reveille mine is three-fourths of a mile from the Bull-Domingo, now being worked by the Neptune Co., which has sunk the shaft 1000 feet, and is taking out concentrating ore which is treated at the mill at Westcliffe. The Bassick is down 1700 feet, ore production running 60% gold, 40% silver. This company has a good mill at the mine; but, owing to the lack of water, will move it to Westcliffe, or construct a new one there. When this is done, the company will build its own railroad from the mine to Westcliffe—a distance of 10 miles—and the D. & R. G. Co. will operate the line for them. It is expected this line will pass the Bull-Domingo and will therefore carry the product of that mine as well.

The construction by the Denver & Rio Grande of a branch from Texas creek on its main line to Westcliffe, a distance of 29 miles—has practically opened up a new

district where an old one once existed. The combination of the gold and silver with the baser metals makes an ore valuable for fluxing and enables the mines in the district to obtain low treatment charges. The altitude of the camp is about the same as that of Cripple Creek; the climate is also similar. The formation is also similar to that in the Cripple Creek district, phonolite, andesite and porphyry being found in contact with the older granite. Fluorine is also found much as in Cripple Creek.

Silver Cliff reports a strike by Haskell & Jackson, who are reported "quarrying out the ore and shipping it by the carload." The ore runs \$44 per ton.

FREMONT COUNTY.

The Work Co. has made a shipment of forty-three tons from the Morning Glory No. 2 of the Dorcas mill at Florence.

GILPIN COUNTY.

At Mountain City the Gregory-Buell is shipping ore.

The October shipments total 405 cars, or 8100 tons, and represent the tonnage of smelting and crude ores, tailings and concentrates shipped to the Denver and Golden smelters, as well as to the Idaho Springs concentrators. For the same period last year the shipments were 350 cars, or 6469 tons, a difference in favor of last month by 55 cars, or 1631 tons, a gain of 25%.

At the East Notaway mine, in Russell and Lake districts, the Town Topics G. M. Co. has forty-five men working on the tribute system. The company will install an electric bell system and is figuring on putting in a larger hoisting plant.

Sinking goes on at the Waltham mine, Russell district. Manager R. H. Hastie says the shaft is down 145 feet and the large crevice still holds out. A daily average of three cars of ore is being shipped over the tramway company lines to the Golden plant for treatment. Lumber is at the mine for a new shaft building; the company is going to install a large gasoline hoisting engine.

The Gregory-Buell property, Central City, has a record as a large producer. In segregated form fourteen different shafts were operated and were all profitable producers. The consolidation promises large results.

LAKE COUNTY.

The Ballard, Penn. President and Big Six, on Breese hill, contain bodies of siliceous ores that run as low as \$12 per ton—too low to ship. In these ore bodies bunches of this low-grade stuff appears, and it takes careful watching to keep the ore up to the required standard when shipping to the smelter. At the Ballard dump it is estimated that there are 25,000 tons that will average \$10. To experiment with this, as well as the low-grade in the mine, they will put in a cyanide plant.

The new mill at the Resurrection property is completed. The plant will treat the low-grade ore by a process never before attempted in the district, whereby it is designed that the great bodies of lead-zinc sulphides will yield three distinct products—a clean zinc, a clean iron carrying gold and silver and a lead concentrate with very little iron and some silver and gold.

The capacity of the Arkansas Valley Smelter will be increased from 3500 to 4000 tons a month; by Jan. 1 it will be handling 28,000 tons of raw materials. The new reverberatories are being fired up as fast as completed; by Jan. 1 twelve of these will have been added to the former capacity. These, with the other improvements made during the past six months, represent an expenditure of over \$200,000. S. Guggenheim says: "We are making these improvements to handle the low-grade ores and to enable us to handle all of the ores here of that kind, especially those which can not be shipped at a profit. We can not treat waste, but the company is bending all its energies to a reduction of the cost of smelting."

LARIMER COUNTY.

The Grant Copper M. Co. at Pearl intend to install machinery and develop their property.

Near Leadville, on the Catalpa Crescent property, Lessee McGreavey is taking out twenty-five tons a day of oxidized iron ore.

The Yak tunnel is being driven at the rate of 5 feet a day toward the Ibox ground. For several years the Ibox Co. has been handling an enormous flow of water which is raised 1000 feet. The tunnel will tap this section at a depth of 1200 to 1300 feet and thus furnish natural drainage to that depth.

At Leadville, S. Guggenheim says that the new zinc smelter now in course of construction will start operation at half its capacity in December, employing 200 men, and will be in full operation by spring. At the Philadelphia smelter, most of which has lately been idle, he stated that it is not to be dismantled or abandoned, but that the suspension is due to ore

trouble, and that the works, after remodeling and enlargement, will employ more men than before. The other two smelters, the Pueblo and the Colorado, are in operation.

OURAY COUNTY.

A decision of interest to mining men is rendered by the Secretary of the Interior in a protest filed by W. F. Mattes against the issuance of a patent for the Meddler lode claim to W. J. Hammond, Jr. Mattes located the Swamp Angel group of lode claims at Red mountain and developed them by a tunnel from the Silverton railroad. Hammond located the Sub-Treasury tunnel; unknown to Mattes he also located the Meddler claim at right angles across a number of the Swamp Angel group. The Meddler was advertised for patent, but Mattes did not learn of it until too late to adverse and filed a protest with the Land Office. Investigation showed that the Sub-Treasury tunnel, in which Hammond claimed to have done the work for the Meddler claim, could only reach the latter by passing through the Corn Cob lode of G. Boss, which in the meantime had been patented, and also through several of the Swamp Angel group, as well as ground that was vacant at the date of the Meddler entry. For this reason he held the entry for cancellation. Hammond appealed; the Secretary confirmed the Commissioner's decision.

PITKIN COUNTY.

Since the Mollie Gibson Co. ceased operations upon the property late in the summer, the adjoining Smuggler Co. has been keeping the mine free from water for its own protection. Several times during the past three months rumors have been started to the effect that the Mollie Gibson Co. had leased its property to the Smuggler Co. It is now stated that this deal has gone through. President Hagerman of the company says the report is correct in substance, although somewhat premature.

SAN JUAN COUNTY.

The new mill of the Silver Ledge mine at Chattanooga will be running next month.

The 900-foot tunnel at the King mine on Sutton mountain is entering the vein which it was projected to cut.

The superintendent of the Henrietta says the seventh level is in 1800 feet, and has drifted the last 300 feet in continuous ore. The same ore body, known as the Henrietta-Lizzie vein, is opened up in levels 1, 2, 3 and 7. It is said that thousands of tons of ore have been blocked out, the milling product running \$7 per ton and the smelting output \$20 per ton.

The Gold Spur Co., in Cunningham gulch, will drive a 200-foot crosscut tunnel.

TELLER COUNTY.

Manager Wright of the Lincoln Co., owning the Lincoln mine near Gillett, reports all debts of that corporation, including a mortgage on the property, wiped out. Work is to be resumed on the mine.

The Portland maintains a daily output of about 250 tons. The average value of the ore is reported a little lower than usual. The bulk of the ore mined is shipped direct to the company mill at Colorado City, running about \$25.

A production of about sixty tons a day is being made from the various shafts on the Hull City placer, owned by the Independence Con. Co.

Taylor & Johnson, leasing on the Pharmacist, have a drift extended on 4 feet of high-grade quartz at the 560-foot level. Assays run \$50. The ore shows rusty gold and sylvanite.

The Findley Co. has sunk its main shaft to a depth of 1300 feet and will continue sinking to the 1400-foot point, where it expects to catch the north extension of the Hull City ore shoot.

The Bonanza King on Gold hill, being worked by G. Bent, has produced \$125,000 worth of ore to the 300-foot level. The greater portion of it was taken out by lessees. Mr. Bent is now working the ground for the third year and is following a small streak of high grade.

Owenby & McFarland are shipping about twenty-five tons daily from their lease on the Emma No. 2 of the Isabella Co.

The Gold Button Co. on Sheep mountain, north of Gillett, is driving a tunnel east from Oil creek, which is now into the mountain about 700 feet, to be continued to the 1000-foot mark this winter.

Sinking is under way in the shaft of the Maid of Orleans. A depth of 500 feet will be reached before any lateral work is attempted.

Superintendent Newell of the Buffalo & Cripple Creek Co. will resume work in the Newell tunnel.

The Cripple Creek sampler, situated on the east slope of Bull hill, is running through from 350 to 400 tons a day. G. Fry is manager.

Stratton's Independence is making an output of an average of 250 tons a day.

Most of the ore comes from the upper levels. The average grade of the ore is lower than it was one year ago. General Manager Cornish has men in the lower levels.

Murphy & Baxter, who have a lease on the old workings of the Isabella, are making a production of about twenty-five tons a day. The ground is being worked by four sets of sub-lessees; all of them are making better than wages.

There are now eleven sets of lessees working on the Anaconda Co.'s ground making steady shipments, ore running from one ounce to five ounces per ton.

The Vindicator Con. Co. is outfitting at the rate of 100 tons a day at present.

Emil Salbach, who has secured a two years' lease on the Friday, situated on Tenderfoot hill, and owned by the White City Co., has started work. The shaft is to be put down an additional 300 feet.

The daily production from the Independence Con. Co., known as the Hull City placer, is sixty tons, all mined by lessees.

In the Cripple Creek district there are in operation five sampling plants, giving employment to 175 men, who average \$3.53 a day.

The largest sampler of the Cripple Creek Ore & Sampling Co. on Bull hill has a capacity of 60,000 tons of ore each month. Considerable of the tonnage of ore produced there each month is first sampled before it goes to the mills and smelters. The sampler in many cases is simply the check. Considerable ore, though, is bought outright by the smelting companies, who in turn sell it to the smelters and mills. The combined sampling capacity of the plants in operation exceeds the output.

The largest force of men employed is in the two plants operated by Taylor & Brunton; that firm has a plant on Battle mountain and another on Bull hill. They employ sixty-five men, who average \$3.50 a day. The Cripple Creek Ore & Sampling Co. employs thirty-five men, average \$3.50 per day. The Eagle sampler, forty men, averages \$3.50 per day. The Rio Grande sampler, thirty-five men, averages \$3.75 a day.

Manager De La Vergne says the Isabella more than paid expenses in September and only lost a small sum in October. He will at once begin to unwater the thirteenth level and go to work there.

On the Gold Coin the Dorothy vein has been opened in the ninth and tenth levels for 525 feet in ore all the way.

Manager Rice of the Stratton Cripple Creek M. & D. Co. has been experimenting with cyanide on the ore of the Ironclad on Ironclad hill. Another mill will be built for these ores.

For some time Altman, the highest incorporated town in the world, has been paving the streets with rock taken from the waste dump of the Pharmacist mine. Some of it looked so well that samples were taken at random and assayed; the returns showed an average value of \$20 per ton in gold. As a result men began hauling away the street surface until stopped by the police. The Pharmacist Co. has ceased giving away the dump and is hauling it to the reduction mills.

The new \$100,000 equipment of the El Paso Con. G. M. Co. is in operation. The new shaft has been put to a depth of 600 feet and made 5½ by 16 in the clear.

The advantages of the leasing system are shown by the reports from the different leases on the properties of the United Mines Co. for October. During the month there was shipped by these lessees 975 tons of ore of a gross bullion value of \$27,000. The net receipts of the company from royalties on a basis of 30% amounted to approximately \$4500. In addition, a large amount of dead development work was executed without cost to the company. Among the properties so operated were the Damon, Trachyte, Hanna Britt, Anna May Wells and Pauper, also the dumps of the Damon and the Wild Horse. The different leases furnished employment for about 100 miners.

The Mary McKinney mine shipped 2597 tons of ore in October, worth approximately \$75,000 gross. The bulk of the rock averaged \$40, the lower grade running about \$20 per ton. The ore came from the third and fifth levels, principally, and is exclusive of the 195 tons shipped by lessees, who pay 25% royalties.

At Cripple Creek the Elkton mine superintendent says he is waiting for some definite action to be taken by the mine owners in reference to a drainage tunnel.

At Victor the Economic and Arequa mills and the cyanide plant on Ironclad mountain had a pay roll of \$8849.70 in October. The first mentioned concern employs sixty-five men, who receive \$3.61 a day. The remaining fourteen men are employed by the two other mills. The Economic mill handles the product of the Gold Coin, the Wild Horse, Deadwood, New Zealand, Damon and other properties owned and controlled by them, the product of the War Eagle and other indepen-

dent mines, and is running almost full capacity. The Arequa mill is handling ore averaging not more than \$8 a ton. The Ironclad cyanide plant is handling a grade of ore running about \$5 a ton, and is treating the dumps of oxidized ores that abound on that hill.

IDAHO.

BLAINE COUNTY.

C. C. Ruthrauff has an option upon a ten-claim group of claims adjoining the Minnie Moore group on the southwest. S. Friend will superintend development work.

IDAHO COUNTY.

Though Thunder mountain has ceased to be a name to conjure with, prospectors through the season have done work enough to warrant attention being directed to the district, which will doubtless be heard from next season.

J. B. Hastings, former manager War Eagle at Rossland, B. C., in the Valley View mines, between Ketchum and Thunder mountain, has a property on which he is putting a 20-stamp cyanide mill. Tests show values of \$13.50 a ton. The cost of mining and milling is estimated at \$4 a ton.

KOOTENAI COUNTY.

G. R. Gordon, representing the Cœur d'Alene Dredging Co., has bonded large holdings of placer ground near Tyson; a good dredger will be built.

The Tyson Con. M. & M. Co. has been organized; F. W. Haverland, manager, and C. Toppings, superintendent. This company owns some quartz claims; the War Eagle, the most promising claim. The Tyson Co. will put in a sawmill, and as soon as material can be had will erect a 30-stamp mill.

The Richmond G. M. & M. Co. expect to arrange to mine a large quantity of ore and have it ready for treatment when the mill is started.

LEMHI COUNTY.

Near Salmon City, on the Kirtley creek placers, a large dredger will be constructed by Wright & Dore. The Kirtley creek placers comprise 1000 acres dredging ground.

Near Junction, the Ross Co. during the summer extended its area; it now holds in one group six mining properties. The concentrating plant demonstrated that their ores carried values of 53% lead, 32 ounces in silver and \$3 in gold per ton. Four carloads have been shipped from their central location. M. Savier, superintendent, will sink and tunnel. It is the purpose to buy a traction engine to ply between their workings and the Union Pacific Railroad at Dubois.

SHOSHONE COUNTY.

The monthly output of the Frisco mine, which is preparing to resume operations, has been placed by the trust at 2000 tons. The mill has a capacity of 650 tons every twenty-four hours. It is estimated that the monthly payroll of the mine running under full force will be about \$30,000.

The St. Joe Basin Placer M. Co. has bought eight claims at the headwaters of the north fork of the St. Joe river for \$95,150—cash \$2000, remainder in installments. W. T. Hales of Wallace is manager of the company. The eight claims are the Mutual, Contention, Keystone, Idaho, Climax, Solace, Snowstorm and Sunshine; located twelve years ago, considerable development work has been done; hed-rock, however, has not been reached; in the spring work will be resumed with fifty men and a sawmill built. The property will be worked by giants. Before the property can be converted into a paying one it will be necessary to drain it by changing the course of the creek, which will require capital. The machinery and other supplies will have to be taken in by way of Iron Mountain, Mont., 25 miles from the diggings.

Regarding resumption of work at the Frisco mine, 4 miles from Wallace, Manager Ehrenberg says they shall probably work 275 men.

S. Ellis, from Pierce City, says about 300 men are at work in the various mining properties. The Wild Rose Co. has not been running its mill since early summer, and during the past five months has been doing extensive development work. The shaft has been sunk deeper, the first lot of ore ever taken from the mine is now on the dump, and a working tunnel is now being run. The company is expecting to start the mill on November 6 for the winter run. He has been running the Santiago mine and mill since last June; average value for milling purposes \$15 a ton. He has fifteen men, but the Santiago mill is a water-power plant and will have to be shut down when the winter comes. The Mascot Co. is working 35 men and a 9-stamp mill on rich ore. The Ozark Co. also has men employed and is producing profitably.

The French creek placers have been worked this season by an Eastern company, which has put in a new gold-working

machine; is run by water power. The earth is elevated on a traveling belt and then run over a quicksilver-coated plate by a series of traveling rollers, that agitate it so that earth, gravel and gold comes in contact with the charged plates. The output of these placers has been large this summer, and it is understood that the mining company will run the plant through the winter.

MICHIGAN.

HOUGHTON COUNTY.

The October output of the Atlantic and Wolverine mines broke previous records. The Atlantic product amounted to 310 tons 1520 pounds. The Wolverine output amounted to 512 tons 600 pounds.

MONTANA.

CASCADE COUNTY.

At Neihart, Wright & Henry are working the old Florence mine, and propose to sink 500 feet.

DEER LODGE COUNTY.

The Anaconda Co. is putting in a new system of drainage, by which all the large mines, including the St. Lawrence, Never Sweat, High Ore, Green Mountain, Diamond, Bell, Modoc and Wake-up-Jim are to be drained of their water through the shaft of the High Ore, which has reached a depth of 2300 feet. Seven large pumps are at work in the High Ore; there is a 90-foot pump for the reception of the water from the other properties. A cross-cut is being driven from the 2200 level of the High Ore to connect with the lower workings of the St. Lawrence, Anaconda and Never Sweat, and, as soon as completed, the water of these three mines will flow into the pump of the High Ore and be forced to the 300-foot level by the large pumps in use there.

In the works of the Amalgamated Copper Co., beginning Nov. 1, surface men work nine hours, instead of ten hours, per day.

MADISON COUNTY.

Basin reports that the Mayflower mine, owned by W. A. Clark, has been abandoned. The development work reached a depth of 1250 feet, and at that level the ore pinched out. The ore was in the nature of a chimney and was one of the greatest deposits of gold ore ever discovered there.

The Hennepin Ore Co., incorporated under the laws of Minnesota as the Norrils M. Co., has changed its name. G. M. Gillette, A. C. Paul, G. W. Bestard and J. B. Briggs of Minneapolis are the incorporators; the latter is the Montana agent.

C. H. Hand has charge of the Watseka mine, near Rochester. A 125-ton concentrating mill is to be added. A shoot of base ore at the 500-foot level will require handling through an ore-dressing plant.

MISSOULA COUNTY.

The Cœur d'Alene mining district, in the western portion of the county, reports a vein of copper ore struck on the Richmond claim of the Bitter Root Copper M. Co., about 5 miles from Saltese. Samples assay 25% copper, \$6 to \$7 in gold and a few ounces in silver. The district in which the claims are located is a continuation of the Cœur d'Alene district of Idaho. Superintendent Cooney has charge of the work at the Richmond and Monitor claims. Work goes on and he contemplates putting in machinery next spring. Elliott Bros. will run a 300-foot tunnel on the Chickamin mine on Lolo creek.

J. A. Nelson has bought the Ward Placer Mining Co.'s property on Hughes creek. Jos. Kastner of Helena will have charge of the camp and the work at the mines. He has had experience in hydraulic mining in Alder gulch and Alaska. A new 6-foot flume is being built. A ditch 4 miles in length will be constructed and the water, when the improvements are completed, will be sufficient to furnish a 300-foot pressure for two hydraulic giants which will be put in. The price paid for the property is \$100,000. A cleanup at the head of the flume amounted to \$3200, the result of a two weeks run. It is expected that about \$4000 will be taken out at the lower end of the flume. The total of the season's work will amount to about \$14,000.

PARK COUNTY.

J. M. McNulty, manager Milwaukee M. Co., at Contact, has let a contract to drive 500 feet of tunnel to open up the lower workings of the mine.

RAVALLI COUNTY.

Hamilton reports plans have been completed for improvements to the plant of the Wood Placer M. Co., on Hughes creek. The flume is to be torn out and another and larger structure substituted. The hydraulic pressure is to be furnished by a long pipe line.

SILVER BOW COUNTY.

Butte reports that the Butte & Boston Co. have stopped work on its properties on the east side. Other mines in the same

district have also been closed, among them the Sinbad and Pacific. About \$200,000 was spent on the Sinbad in an effort to find the veins that are supposed to strike in that direction from the Minnie Healey and other mines. F. Farrell is still working on his mines in that district. The other mines of the Butte & Boston Co. are being worked and the company is making some money. Last year its reported net earnings were \$166,136.

NEVADA.

CHURCHILL COUNTY.

D. J. Noyes is at Lovelock from New York and says the American Nickel Co. will resume work on its property at Cottonwood at once. He estimates there is 16,000 tons of nickel ore in the company's mines.

ESMERALDA COUNTY.

Eighteen men are working in the lower tunnel of one of the Blair group of mines at Silver Peak.

In San Francisco, after nineteen years of legal delay, has been tested ownership of a group of mines in the Candelaria district, suit being instituted in the name of the Southern Nevada M. Co. against the Northern Belle M. Co., in which Alvinza Hayward is the principal owner. The defendants were accused also of extracting ore from the plaintiff's property. Damages in the sum of \$48,000 were awarded the plaintiff as well as title to the property involved.

The old Wilson gold property at Pine Groves is bought by Cutting & Hudgens, stated price \$75,000; a payment of \$30,000 was made. The new owners have organized the Pine Grove G. M. Co. and propose to work the property above the water level, to tap the ledge at a vertical depth of 500 feet by running a tunnel 1800 feet, and, as the ledge lies flat, they will have 1000 feet of stope.

EUREKA COUNTY.

Ore shipments by rail from Eureka district for the week ending November 7 were: Eureka Con. 32,900 pounds, Excelsior 160,710 pounds.

LINCOLN COUNTY.

The DeLamar bullion product last month was \$26,956.

The Nevada Keystone M. Co. at Sandy on the 300-foot level has an ore body measuring 6 feet in width and assaying \$200 per ton. The 200-foot level is completed to the 100-foot stope, showing 4½ feet in width of ore assaying \$184 per ton. The mine has been developed to a depth of 450 feet. The mill and cyanide plant, 7 miles from the mine, are running night and day and bullion is being shipped monthly.

In the McGee mines, Silver King district, northwest of Pioche, ore is exposed in the various workings along three different ledges, assaying 20 ounces silver, 20% lead and \$1 gold per ton. Close at hand is pinon pine and cedar, which can be laid down at the mines for \$4.50 per cord.

NYE COUNTY.

Water is flowing in Tonopah. A shipment of ten tons of coal has been received in Tonopah from a deposit 35 miles northeast of that place.

The Honnapah M. & S. Co., S. Newhouse president, will work properties 18 miles east of Tonopah.

STOREY COUNTY.

C. Butters will make Virginia City the headquarters of the Butters Co. and will work the old dumps in that section.

WASHOE COUNTY.

There are forty men employed by the Pacific Con. M. Co. at their Pyramid Lake property.

A strike is reported in the Desert King mine, near Reno, of a ledge 7 feet wide.

The Desert King and Wedekind mines employ eighty men.

WHITE PINE COUNTY.

W. T. Hook, manager New York & Nevada Co., Ely, is closing up a deal for the waters of Murray creek, near Ely, for \$35,000.

NEW MEXICO.

SOCORRO COUNTY.

The cyanide plant recently installed by the Last Chance Co. at Mogollon is reported to be a success; 1200 tons of ore are being treated monthly.

GRANT COUNTY.

Near Lordsburg, Supt. B. W. Randall of the American Con. Copper Co. expects to put in a mill and treating plant.

S. L. Bean of El Paso, who owns the Metropolis and Hidalgo properties, has shipped there a concentrate test of 100 tons and will erect a reduction plant on their property.

The Lena mine is being unwatered. Supt. Hempsted says he will resume sinking.

OREGON.

BAKER COUNTY.

Sylvante has been discovered in the

Greenhorn district. Supt. Lohmyre of the Maxwell mine says should the ore body increase the mill will be put in operation in the spring.

Supt. Neel says the capacity of the new Sumpter smelter will be 200 tons.

The Advance M. Co. has in its 180-foot tunnel on the Storm King claim ore 2 feet wide. Assays give \$62 per ton in gold.

Brown & English are in Quartzburg district to erect a reduction plant.

Work on the Lucky Boy group of claims will shortly begin.

A recent shipment of twenty-five tons of ore was from the Chloride mine in the Greenhorn, averaging \$100 to the ton.

GRANT COUNTY.

The Pomeroy dredger, to mine the placer bottom of the North Fork of the John Day and Canyon creeks, has been in operation two months on the North Fork below John Day City. It will not run this winter. Twelve cords of wood a day are required to run it.

MALHEUR COUNTY.

Machinery is being received at the Black Eagle mine—a 20-stamp mill, drills and engine. This property is located on a porphyry dike, carrying low-grade ores.

JACKSON COUNTY.

In Wolf creek district ditches are being enlarged, new flumes built and preparation made for the operation of the hydraulic mines this winter. Scriber & Henderson have in a new arrastra that will break eighteen tons of rock a day. The Wolf Creek M. & D. Co. has men at work on their quartz and placer properties.

JOSEPHINE COUNTY.

Supt. Ryan is developing the Harth quartz property, near Woodville. A tunnel will tap the vein at a depth of 200 feet.

The Sowell copper mines of Althouse district have closed down temporarily. Six tons of smelted copper matte are shipped to San Francisco.

The new group of copper mines at Althouse, in the Grey Back mountain, located last year by Babcock & Kitterman, are under development.

T. W. Draper, manager Waldo S. & M. Co. at Waldo, says his company will put in a 100-ton smelter at Takilma, a new town that has sprung up near the mines and on the line of the proposed Oregon & Pacific railroad.

SOUTH DAKOTA.

CLARK COUNTY.

At Garden City the Penobscot M. Co.'s stamp crushing cyanide mill is ready to be connected.

The Arcade M. Co. shaft expects to reach quartzite in 100 feet more. P. O'Dwyer of Central City is manager.

CUSTER COUNTY.

Cleveland, Ohio, men have organized the Central Black Hills Co., which is opening up a body of copper carbonate ore about 15 miles northwest of Custer City. A plant of 100 tons daily capacity is being built to treat the ore. A leaching process will be used to extract the copper, the tailings will be subjected to the cyanide process to recover the gold values. The mine is opened up by tunnels and open cuts disclosing bodies of ore, situated so that it can be mined very cheaply, it being on a high mountain with a perpendicular face. The ore can be quarried and handled by gravity to the mill.

The Central Black Hills Copper Co. is opening up a body of copper carbonate ore about 15 miles northwest of Custer City. A plant of 100 tons daily capacity is being built to treat the ore. A leaching process will be used to extract the copper, and the tailings will be subjected to the cyanide process to recover the gold values. The mine is opened up by numerous tunnels and open cuts. It is so situated that it can be mined cheaply, it being on a big mountain, with a perpendicular face. The ore will be quarried and handled by gravity to the mill. The mining will be done by steam drills.

LAWRENCE COUNTY.

The Homestake is daily producing 3000 tons gold-bearing ore; 960 stamps are dropping continuously. The ores last year averaged \$3.65 gold per ton; about 3000 persons are employed in their extraction and treatment.

At Lead the Globe M. Co. has two carloads of machinery for the shaft in Nevada gulch. The company is beginning deep exploration work and the shaft recently started is designed to go down from 500 to 1000 feet before crosscutting to open the vein.

The property of the newly organized Potsdam G. M. Co. is 9 miles west of Deadwood, in the Ida-Gray mining district (Ragged Top), on the west of the Spearfish canyon, adjoining on the north the territory of the Gold Hill M. Co., and on the east the properties of both the Deadwood-Standard G. M. & M. Co. and the Spearfish G. M. & R. Co., and covers 570

acres, including among its groups of claims the Puritan, the Dorn and the Lee. The Lardner lode, and the Puritan, Dorn and Lee groups are patented; the remaining ground is being surveyed for patent. The ore is a soft minersillized limo gangue.

The Spearfish Co. operates a 250-ton cyanide plant, and its monthly cleanups average about \$30,000. This mill, built on the site of the mill which burned a year ago, was put into operation last spring; in September the mill was paid for; in October the company declared a regular monthly dividend.

The Gold Hill M. Co. is sinking for quartzite in Johnson gulch, at a present depth of 300 feet.

The Deadwood-Standard G. M. & M. Co. is opening up a new ore body and is taking out ore from seven points on the south foot of Ragged Top mountain. A trestle connects the present workings with the upper story of the mill. The process employed is the dry crushing; the crushing is to 1/4 inch mesh. The extraction is from 80% to 90%. The mill is operated by one ten-hour shift, handling 3000 tons per month, filling one tank per day. Thirty-five men are employed. S. B. Morrison is superintending the mill, E. Hanschka has charge of the mining.

PENNINGTON COUNTY.

The Columbus M. Co. will order a steam hoist and other machinery for its property near Rochford. Ore has been found. It is free milling and concentrating, worth \$40 a ton.

The Golden West M. Co., which recently purchased the Benedict, Yellow Bird and associated claims in Hornblende camp, 5 miles from Rochford, is developing the properties. There is a Chilean mill on the Benedict, which was operated before the new company was organized and which is soon to be started again.

The Gregory M. Co. is continuing the lateral workings from the bottom of the Montana shaft, near Nahant. The ore is largely pyritic and is regarded as an excellent concentrating or smelting proposition.

At Keystone the Mount Atna G. M. Co. has completed the new hoist at the shaft on the Lucky Boy.

C. J. Sine is experimenting on the ores of the Tycoon G. M. Co. with cyanide.

UTAH.

BEAVER COUNTY.

At Frisco, Superintendent Johnson of the Cactus reports a strike 400 feet west of the former one in the upraises from the second, third and fourth levels of chalcopryrite in a solid mass.

BOX ELDER COUNTY.

The Liberty Bell M. Co. has incorporated. The company has nine claims—the Silver King lodes; H. Cohn, E. M. Friedman, A. W. Mountney, W. W. Pitt.

JUAB COUNTY.

The Centennial Eureka at Tintic has a body of ore which averages 52 ounces silver, 5% copper and \$6 gold per ton. Superintendent Brown on the level above has drifted 130 feet on the channel, which has been crosscut for 46 feet with but one wall exposed. He has 3000 tons of ore to be delivered. He is adding to the bins between the railway tracks—for the gold and silver ore, the heavy copper ore and the medium copper ore with gold and silver. About 100 miners are employed on the property.

SALT LAKE COUNTY.

The management of the Highland Boy smelter forwarded 300,000 pounds of copper bullion, carrying silver and gold, to an Eastern refinery last week.

At Alta, H. Wallace, manager Grizzly and Lavinia, has copper ore in the Grizzly and is shipping ore carrying silver, lead and gold from the Lavinia. At the Columbus, Superintendent Jacobson has good ore. Superintendent Rooklidge has silver, lead and gold ore at the Oxford. On the City Rocks and Morrill & Sowles groups work is progressing. A long tunnel is being run by Manager Hatfield of the Albion—now in 760 feet.

The consolidation is announced of the York and Copperfield group of eleven patented claims and the transfer to the Utah Apex M. Co. W. C. Orem, manager, has blocked out 6000 tons of milling ore; in the tunnel workings of the York ore running 40% lead and from eight to ten ounces silver per ton has been mined.

SUMMIT COUNTY.

Superintendent Mixer of the Creole, at Park City, in the rehabilitation of the old workings, has exposed ore in several places.

WASHINGTON.

FERRY COUNTY.

The Tom Thumb mine at Republic will not resume operations until the Washington & Great Northern line is completed into Grand Forks.

OKANOGAN COUNTY.

R. Insinger of the American Flag M.

Co., on the Methow, has closed the 20-stamp mill after making a run of 500 tons of sample ore from the mine. It is the intention to put in a cyanide plant in the spring.

PIERCE COUNTY.

Engineers at Tacoma propose to work a project to utilize the headwaters of the Puyallup river from the glacier on Mount Rainier. It is claimed that if successful this will be the first instance where glacial waters have been used directly to provide power. The plan is to construct from the glacier a flume 14 miles long through which a head of water will flow sufficient to generate 50,000 H. P. The water in running through the flume will drop 600 feet, and through penstocks will be diverted into turbines connected with electric generators. A three-phase alternating current is to be transmitted at high voltage to Tacoma and Seattle.

STEVENS COUNTY.

The Easter Sunday mine, on the Colville reservation, west of Bossburg, is installing a 16-drill compressor and a 90 H. P. hoist. It is also putting in a 50-ton mill. The mine is a gold-copper property.

WYOMING.

CARBON COUNTY.

The What Cheer Copper M. Co. is developing property on Dunkard creek, Encampment district. One tunnel in 337 feet has opened up a number of streaks showing bornite and carbonate of copper. In a shaft 200 feet up the hill from the tunnel are kidneys of copper glance and quartz carrying copper assaying 9%.

FOREIGN.

BRITISH COLUMBIA.

A company has been formed in Revelstoke to operate the Beatrice, at the head of Mohawk creek.

A group of claims, headwaters North Fork of Kettle river, are bonded for \$60,000 to J. Moran of New Denver, 10% in sixty days, 20% in four months, the balance in six months. It is a galena proposition and has assayed 590 ounces in silver and 15% copper to the ton. The group is reached by way of Arrow lake and Fire valley.

Regarding zinc in the Sandon ores and a demand for that metal in the United States, in response to an inquiry the acting Secretary of the U. S. Treasury says as to whether raw zinc ores are dutiable when imported for smelting and consumption, that there is no specific provision in the present tariff act, and there has been no decision of the Board of U. S. General Appraisers or the courts as to the classification of crude zinc ores, and that question is one which is primarily determined by the collector of customs, but in all probability the ores would be held dutiable at 1 cent per pound.

The recent vote of the Fernie miners on the continuance of the hours of work compromise at eight and one-half underground, stood: For eight and one-half hours underground, 33; for eight hours underground, 129; cast no vote, 108. The result is not satisfactory to either side. The miners claim that they are now entitled to the old system, but the management maintains that those not voting show by their indifference that they are perfectly satisfied with the present.

W. J. Robinson is in San Francisco from Atlin with \$5000 in gold. His company owns 1000 acres, and he has come out to contract for a gold dredger similar to those so successfully operated on the Feather river at Oroville in California. During this season almost 100 men have been at work at Atlin and they have cleaned up \$2,000,000. He says the miners at Atlin have cleaned up 25% more gold to the man than the miners have on the Klondike. Work at \$6 a day could have been given to more miners had they been there to operate claims.

The recently boomed gold-producing black sands at Wreck Bay, Vancouver island, seem to have become exhausted, after making good yields during two seasons.

At the Highland mine, Ainsworth, L. Cortiana says the concentrator is at work. There are forty-five men employed on the property; good ore is being taken out.

The Granby mines use thirty tons of powder a month, and the Le Roi twenty tons a month. The tariff on powder is 3 cents a pound, which for these two mines totals \$30,000 per annum for duty alone. The same applies to fuse, candles, steel, etc.

At Sandon an offer of \$11 per ton, made by the C. P. R. last week, is accepted by the mine owners, who are getting ready to ship their zinc to Missouri.

The Bosun at New Denver is preparing to ship 250 tons to the Lanyon smelter, which heretofore went to Antwerp, in Belgium, and will increase its force to seventy men.

Boundary mines last week produced

12,000 tons. The Granby mines shipped 5072 tons to the smelter; Mother Lode, 4256 tons; Sunset mine, 630 tons; B. C. mine, 990 tons; Snow Shoe mine, 720 tons; Emma mine, 350 tons; total for the year to date, 409,773 tons.

Rossland reports that the profits of the Le Roi Co. in October were over \$85,000.

The report of the directors of the Hall M. & S. Co., Ltd., of British Columbia, for the year ended June 30, 1902, states that in consequence of the exhaustion of the ore reserves, and the necessity therefore for writing off the amount of £19,571, charged to development account at June 30, 1901, and also writing off £1094 from the value of the mine supplies, there is a loss on the mining account of £6980; on the other hand, the smelting account shows a profit of £5071. After taking credit for sundry receipts, £1735, and providing for the general expenses, including debenture interest and the balance of preliminary expenses not dealt with last year (together £5772), there is a loss of £5945, which, together with £6673 written off for depreciation, must be added to the amount brought forward from last year—viz., £6980—making a total debit balance to be carried forward of £19,599. It was not until the spring of the year that the permanence of the ore body at the lower levels became doubtful. Before deciding to abandon operations, the board subsequently had the mine examined by the best expert available, whose views entirely coincided with those of the other two. The board has leased the mine to M. S. Davys, former superintendent.

FRANCE.

The striking coal miners show great dissatisfaction at the arbitration decision against a raise in the rate of wages and their national committee has called a meeting at Arras. At St. Etienne the miners have adopted resolutions to appeal to the dock laborers to renew the strike against loading coal unless the companies grant the miners' terms.

MEXICO.

DURANGO.

The Mexican Central has signed a contract with the Governors of the States of Durango and Zacatecas for the immediate building of a line from Gutierrez, on its main line, to the city of Durango, a distance of about 120 miles. The construction of the road will begin as soon as the Legislatures of the two States approve the contract.

SONORA.

Cananea reports that the production of bullion during the month of October is 5,000,000 pounds ahead of any previous month in the history of the company's operations. The management expects to do better this month.

La Mexicana mine, operated by F. Morgan, has resumed. This company is now composed of New York men. The management is still retained by Mr. Morgan. T. Johnson, of El Paso, Texas, says the United States M. & S. Co. has been incorporated in New York to operate the Ahogado gold and silver mine, on the Sonora river, 30 miles above Hermosillo. The mine was formerly known as the San Jose de Gracia.

J. S. Williams, Jr., assistant superintendent Montezuma M. Co., at Nacosari, in regard to the properties there which belong to the Phelps-Dodge people or the Bisbee Co., says they have a concentrating plant capable of reducing 200 tons daily and have a railroad 5 miles long from the mines to the concentrators and smelters. A tunnel 5000 feet long cuts the ore about 700 feet below the upper tunnel. The ore body, with both tunnels cut across it, is over 5000 feet wide, and the ore continues up the mountain from the upper tunnel a distance of 700 feet. The ore is very base and is first concentrated and then the concentrates smelted and the matte then run into the converters. The ore carries a fair percentage, and, with the completion of the railroad from Cos to Nacosari, will materially increase the profit, as a gr at saving will be made in the hauling of coke, etc.

TAMAULIPAS.

The Mexican Petroleum Co., A. P. Maginnis, manager, operating at Ebano, has three oil wells which will yield on an average 100 barrels per day.

NEW ZEALAND.

The Minister of Mines reports the total number of dredgers in the west coast and southern districts: Working, 183; building, 59; standing, 33; undergoing removal, 19; total, 224. It is estimated that this branch of mining finds direct employment for 2000 persons, apart from the men employed in building dredgers and machinery and in repairs.

There are thirty cyanide plants in New Zealand, three using charcoal, the others zinc shavings.

PERU.

Minister I. B. Dudley at Lima, in a report to the State Department on the copper industry of Peru, and American participation therein, says owing to the fall in the price of copper, the entire industry has undergone "a certain paralysis," but it is expected that the energy and ability of Americans (who have established some of the largest plants in Peru) will contribute to the highest prosperity of the copper industry. The introduction of American methods of exploitation and of American machinery already have reduced the cost of production to "an incredibly low figure," and the building of new railroads have enabled even the native miners to find a new and wider sphere for the industry.

PORTO RICO.

A. R. Gibson of Silver City, N. M., has received from Porto Rico twenty ounces of coarse placer gold which assays 20 cents fine. W. M. H. Woodward of Silver City leaves for San Juan, taking an outfit for assaying, and will do development work.

SOUTH AMERICA.

CHILE.

The long legal contest between the Santiago and Liverpool nitrate companies has been decided by the Chilean courts in favor of the Santiago Co.

THE KLONDIKE.

In the volume of business which the United States consulates of the world handle, Liverpool, London and Paris only rank ahead of Dawson. Berlin is fifth. The total valuation of traffic in connection with the American government over which the United States Consul has had supervision the present open season on the Yukon is \$11,000,000. This represents chiefly gold shipped from Dawson to the United States, commodities shipped from Dawson under consular invoice to lower Yukon points and the supervision of the payment of wages to steamer men who signed on American vessels on the Alaskan side and were paid here.

Personal.

W. C. GREEN has returned to Cananea from the East.
J. H. BROWNLEE of Atlin, B. C., is in Seattle, Wash.
C. D. HEBBARD has returned to Siskiyou county, Cal.
F. R. CULBERTSON of Washington will winter in California.
S. D. NICHOLSON is manager Auric M. Co., Lake City, Colo.
J. SEWARD is manager Mohave G. M. Co., Leland, Arizona.
ROBT. JONES is manager Pike's Peak Power Co., Victor, Colo.
L. W. CRANE is superintendent at Uncle Sam mine, Gilbert, Ariz.
GEO. W. KIMBLE has returned from San Francisco to Oroville, Cal.
W. F. SNODGRASS is now manager Kelvin Copper Co., Florence, Ariz.
J. L. RUSSELL is manager Witch's Head M. Co., Montezuma, Colo.
J. P. GRAVES has been re-elected manager Granby, B. C., Con. M. Co.
P. TRAIN is superintendent Golden West M. Co., Rochford, South Dakota.
L. H. CARVER has returned to San Francisco from Grass Valley, Cal.
H. S. MOREY has returned from Georgetown to Placerville, Cal.
H. A. TITCOMB has returned to Denver, Colo., from Lake county, Colo.
T. C. MEYER is superintendent Hotchkiss M. & Red. Co., Lake City, Colo.
ROBT. BELL, of Blackfoot, has been elected State Mine Inspector of Idaho.
J. PHILLIPS has resigned as millman at the Mt. Jefferson mill, Groveland, Cal.
G. M. McDOWELL is manager Con. Copper Mines of Idaho, Mineral, Idaho.
H. L. TEAGARDEN has returned to Boulder, Colorado, from Reno, Nevada.
D. P. JONES is general manager Steamboat mine, Alleghany, Sierra county, Cal.
CHAS. LERCHEN succeeds G. Branham as manager Georgetown, Cal., G. M. Co.
G. E. VOORHEES JR. has charge of the Las Vegas copper mines, Coyame, Mexico.

W. J. GOLPIE has been appointed gold commissioner for Ymir, B. C., vice J. A. Turner.

W. HUTCHINSON has resigned the foremanship of the Tomboy M. Co., Telluride, Colo.

J. C. H. FERGUSON, San Francisco representative Midvale Steel Co., goes East November 30.

J. DRENNAN at Sisson, Cal., is superintending development of the Rainbow

group of mines for the Mount Shasta G. M. Co.

F. V. PATTEN succeeds W. M. White in the management of the smelter at Beaver, Utah.

W. L. SHAFFER is now superintendent Pittsburg Con. M. & T. Co., Idaho Springs, Colo.

GENERAL SUPERINTENDENT HARRISON of the Mount Shasta M. Co. is now at Winthrop, Cal.

T. H. TRACY has been appointed manager of sales of the Mine & Smelter Supply Co., Denver, Colo.

E. JUESSEN of Spokane, Wash., has established a branch office at Sumpter, Or., in charge of R. H. Clark.

R. H. CAMPBELL, who has extensive mining interests near Barkerville, B. C., is sojourning in San Francisco.

F. BRADLEY has been appointed superintendent Sierra Railway, Jamestown, Cal., vice W. C. Potts, resigned.

A. D. GASSAWAY, superintendent Union Blue Gravel mine, has returned from San Francisco to North Bloomfield, Cal.

W. P. DUNHAM, general manager Independence Con., Cripple Creek, has returned to Colorado from California.

SUPERINTENDENT KEATING of the Bully Hill mine has returned to Redding, Cal., from southern California.

J. E. SPURR, U. S. G. S., is in Tonopah, Nevada, to oversee the work of making a geological survey of the district.

C. L. RATCLIFF has returned to San Pedro, N. M., from an examination of the New Comstock mines, Kingman, Ariz.

E. B. HACK is in Denver, Colo., from the Camp Bird mill, Ouray, Colo., making changes and alterations in the cyanide mill.

A. C. BEATTY has returned to Denver, Colo., from Butte, Mont., where he had been examining the Heinze copper properties.

D. T. KISSELL, former superintendent Anchor mill, Park City, Utah, is now acting in a similar capacity at the Sheba mine, Mill City, Nev.

W. NICHOLLS, former foreman of the Morning mill, has returned to the Cœur d'Alenes as superintendent Empire State mill, Wardner, Idaho.

GEO. KINGDON, formerly of Hanover, N. M., is now at Bacoachi, Sonora, Mexico, where he has charge of some mines for Phelps, Dodge & Co.

H. SALMON, superintendent of stamp mills L. S. J. Hunt's gold mines, Corea, has returned after a four years' absence. He will spend the winter in Michigan, returning to Corea next spring.

H. K. WHEELER is engaged in engineering work for the Gold Road Mining & Extraction Co., Mohave county, Arizona, who are building reduction plants in that section. Mr. Wheeler will return to Los Angeles, Cal., about the 20th inst.

A. G. WILKES, formerly with the San Pedro G. & C. Co., Santa Fe, N. M., has gone to Agua Calientes, Mexico, as foreman for the American Smelting & Refining Co. The works of the San Pedro G. & C. Co. were closed down November 1 and all the employees discharged.

Obituary.

JNO. M. BUFFINGTON, former superintendent Wyoming mine, died at Nevada City, Cal., on the 3rd inst., aged 53.

Book Notices.

"A Manual of Drawing," by C. E. Coolidge, assistant professor of machine design, Sibley College, Cornell University; 8vo, ninety-two pages, ten full-page plates, paper, \$1. John Wiley & Sons, New York.

"The Design of Simple Roof Trusses in Wood and Steel, with an Introduction to the Elements of Graphic Statics," by Malvered A. Howe, C. E., professor of civil engineering, Rose Polytechnic Institute; member of American Society of Civil Engineers; 8vo, X+129 pages, sixty-seven figures, three folding plates, seventeen tables, cloth, \$2. John Wiley & Sons, New York.

Catalogues Received.

"It never wears out" is the taking title of the Elaterite Roofing Co.'s catalogue, an illustrated description of this "mineral rubber," with showing of what it is and the value of its use; issued by the Elaterite Roofing Co., 713 Market street, San Francisco.

A descriptive catalogue of assayers' and chemists' cupel machines, hydrocarbon burners, blowpipe outfits and furnaces, handily arranged and full of the practical

illustrated information most likely to be wanted by prospective purchasers, is received from the firm of F. W. Braun & Co., 501-505 N. Main street, Los Angeles, Cal.

A clever little manualette comes from the S. H. Supply Co., Twenty-second and Larimer streets, Denver, Colo., showing the growth of the company's business and modestly maintaining that it was just plain ordinary hustling that made it grow. Incidentally is noted that the company handled 118 carloads of machinery from Cripple Creek in three months.

Commercial Paragraphs.

THE Mine & Smelter Supply Co. of Denver, Colo., have an order for eleven Wilfley concentrating tables from the Anaconda Copper M. Co., Anaconda, Mont.

MASURITE, the new explosive company, is establishing a magazine in the vicinity of San Francisco. G. W. Myers, the Pacific coast agent, says the number of orders and inquiries in regard to masurite exceeds expectations. He expects a large consignment of masurite in the immediate future.

THE Burt Mfg. Co. of Akron, Ohio, have just closed a contract for four large Cross oil filters of special style for use on four new battleships now being built for the Government. In this connection they call attention to the fact that their filters have now been adopted by ten different governments.

CHAS. C. MOORE & Co., 32 First St., San Francisco, Cal., have accepted the agency of the Holthoff Machinery Co. of Cudahy, Wis., on the Pacific coast. They state that this company's machinery is now being installed in a great many of the new mines on the coast and in New Mexico and Arizona. Chas. C. Moore & Co. say they are now ready to accept any proposition to install complete mining and smelting plants of any size and that they will do their best to keep up the good name they have already established on the Pacific coast.

THE J. H. Montgomery Machinery Co., Denver, Colo., report sale of one 2-horse steel whim, knocked down for mule-hack transportation, for Krakauer, Zork & Moye, Chihuahua, Mexico; steel pipe line for carrying water up into a flume, working against 120-foot head, for the Highland Valley Power Co., Highland Dam, Idaho; pressed steel ore hockets for Ketelsen & Degetau, Chihuahua, Mexico; six ore cars for Arps Bros. Hardware Co., Ouray, Colo.; hoisting plant for C. C. Bourne, Carrizozo, N. M.; steam drilling outfit for Kaylor Bros., Grand Encampment, Wyo.; four No. 6 ore buckets for Shless & Co., Torreon, Mexico.

New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING NOVEMBER 4, 1902.

712,474.—GAS GENERATOR—D. Barnard, Bakersfield, Cal.
712,486.—FURNACE—C. S. Batbelder, Spokane, Wash.
712,558.—CORN PARER—E. Dellwig, S. N. Jose, Cal.
712,559.—MOTOR CONNECTIONS—Donnat & Greenmeyer, Los Angeles, Cal.
712,561.—CHUTE GATE—H. L. Dunn, Seneca, Cal.
712,568.—CAN BODY FORMER—J. Eldridge, S. F.
712,577.—BABY CARRIAGE SEAT—M. Elwert, Lodi, Cal.
712,736.—DOLL—W. G. Flint, San Jose, Cal.
712,967.—ANIMAL EXTERMINATOR—J. V. Goulardt, Hayward, Cal.
712,530.—CURRYCOMB—J. Herfert, Tucker, Wash. S. F.
712,795.—CALCULATING MACHINE—A. Hoch, Alameda, Cal.
712,650.—SUBSOIL PLOW—T. J. Hubbell, Pasadena, Cal.
712,935.—SOLDERING IRON—A. G. Kaufman, S. F.
712,941.—TACKLING—M. Lamond, Oakland, Cal.
712,699.—HAT FASTENER—Leu & Sjostrom, Los Angeles, Cal.
712,686.—BRIGUETTE MACHINE—R. Martin, S. F.
712,938.—BICYCLE—J. W. Master, San Diego, Cal.
712,938.—ROTARY SCRAPER—R. H. McCaughey, Campbell, Cal.
712,576.—DENTAL TOOL—J. F. O. McMath, Oakland, Cal.
712,953.—TOE CLIP—F. J. & W. H. McMonies, Portland, Or.
712,701.—DENTAL TOOL—A. F. Merriman Jr., Oakland, Cal.
712,944.—SHIP LOADING DEVICE—W. F. Mills, S. F.
712,959.—HOISTING BOOK—C. F. Pohlman, Spokane, Wash.
712,592.—ROCK DRILL—J. Puecbagut, Black Diamond, Wash.
712,721.—V. PORIZER—N. L. Rigby, Los Angeles, Cal.
712,722.—GAME TABLE—E. R. Robbins, Sacramento, Cal.
712,723.—CLOCK—H. Schumacher, S. F.
712,734.—BORING DRILL—A. C. Shuster, Bakersfield, Cal.
712,612.—BALLOT MARKER—T. C. Spelling, S. F.
712,940.—DENTAL BRIDGE WORK—E. L. Townsend, Los Angeles, Cal.
712,941.—DENTAL TOOL—E. L. Townsend, Los Angeles, Cal.
712,933.—HAMMER—G. F. Volbt, S. F.
712,938.—GAS STOVE—T. R. Warren, Glendale, Cal.
712,939.—ADDRESS HOLDER—D. E. Werts, Grants Pass, Or.
712,879.—OIL BURNER—D. C. Wilgus, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOTTLE LOCK.—No. 712,444. Oct. 28, 1902. W. E. Swett, San Francisco, Cal. This invention is designed to securely lock bottles after they have been filled to prevent tampering with the contents. It consists in forming the bottle with a frangible chambered lug cast upon one side, having a spring-pressed bolt located in the chamber, and in the formation of a stopper with a corresponding chamber or slot into which the bolt is forced when the stopper is in place, whereby the removal of the stopper can only be accomplished by breaking the frangible lug to release the bolt.

STRAP CONNECTION FOR GARMENTS OR THE LIKE.—No. 712,353. Oct. 28, 1902. M. Dattlebaum, Oakland, Cal. The object of this invention is to make connections for straps such as are used on trousers, vests and wearing apparel, and is also applicable for making connections wherever buckles are used. It consists of a plate having a plurality of studs projecting from its face and adapted to pass through openings or holes made in the parts to be connected, these studs having heads or slots in the end and the ends of the straps to be connected are formed with suitable bores, so that one of the studs may be inserted into one strap and the other into the one with which it is to be connected, and any adjustment is thus easily made.

COMBINED STOP AND RELEASE MECHANISM FOR PLOWS.—No. 712,371. Oct. 28, 1902. V. T. Gilchrist, Benicia, Cal. Assigned to Baker & Hamilton of San Francisco, Cal., a corporation of California. This invention relates particularly to means for supporting and regulating the movement of the rear bearing or caster wheel of wheeled plows. Its object is to provide a simple stop and release mechanism for the axle of said wheel, whereby the latter may be held against lateral movement outwardly or may be left free to swing in either direction. The invention consists of a vertically adjustable bearing block for the rear axle, an angular lever plate pivoted on the frame and having a stop engaging said axle, a foot lever pivoted intermediate of its ends, and connections between said lever and said lever plate whereby the latter is thrown in and out of engagement with the axle, as desired.

GEOGRAPHICAL CLOCKS.—No. 712,729. Nov. 4, 1902. H. Schumacher, San Francisco, Cal. This invention relates to a device for instantly determining the time upon any meridian in the world and the relative time of different meridians. It consists in the combination in a timepiece of a fixed annular dial with time subdivisions marked thereon, a central disk independent thereof having a polar map and meridians of the northern hemisphere radiating from the center to the periphery, with time indicating hands turnable about the common center whereby the meridians other than that which coincides with the hour hand will indicate correct time at those points, and points or rays of substantially triangular shape projecting radially from the periphery of said disk and coinciding with the meridians of places in the southern hemisphere whereby the relative time of all places in both hemispheres is simultaneously indicated.

HYDROCARBON BURNER.—No. 712,879. Nov. 4, 1902. D. C. Wilgus, San Francisco, Cal. This invention relates to that type of hydrocarbon burner wherein oil and steam or air are conducted independently to the casing of the burner and are thence discharged within the combustion chamber of the furnace. It consists in combination in a hydrocarbon furnace of separate oil and steam feed pipes, controlling valves in said pipes, valve stems having diametral notches on their ends by which they may be engaged and turned independently, link and lever connections between said stems whereby they may be operated in unison, a bladed draft regulator and connections therebetween and said valve connections whereby the draft may be operated simultaneously with said valves.

MARINE PROPULSION.—No. 712,677. Nov. 4, 1902. R. B. Hewson, San Francisco, Cal. This invention consists in the novel construction of propellers having a variable pitch and mechanism by which the blades may be reversed and the combination therewith of a high speed engine, such as the steam turbine, the mechanism being of such a character that the pitch of the propellers may be varied or the position of the blades reversed without reversing the engine or driving mechanism or decreasing its speed of rotation.

GAME TABLE.—No. 712,722. Nov. 4, 1902. E. R. Robbins, Sacramento, Cal. Assigned to J. E. Lynn and B. J. Lynn of same place. This game consists essentially of a long narrow level table solidly supported upon suitable legs having surrounding rails or cushions. Centrally arranged with relation to said cushions is a narrow raised track or path with depressed channels upon either side, the whole being covered with billiard or suitable cloth. At one end of the centrally raised track are positions for miniature tin pins. In intermediate between the ends is a spot upon which the object ball is placed, and near the opposite end of the track is a line or position within which a cue-ball is placed. By a stroke of the cue this ball is impelled against the spot ball, and the latter, if accurately struck, will be driven along the track and against the pins. The game is a combination of billiards and ten pins.

DEVICE FOR LOADING VESSELS.—No. 712,948. Nov. 4, 1902. W. F. Mills, San Francisco, Cal., one-half assigned to J. H. Bennett, San Francisco, Cal. The object of this invention is to combine in a single working apparatus an endless traveling carrier, one end of which is movable and adjustably located upon the wharf from which the load is to be taken and the other is turnable and adjustably connected with the chute upon which the load is to be received and by which it is directed to the point of deposit upon the vessel, and in conjunction therewith of a means carried by the apparatus to provide the necessary power for driving the belts, with adjustments therefor.

CHUTES AND DISCHARGE GATES.—No. 712,661. Nov. 4, 1902. H. L. Dunn, Seneca, Cal. This invention comprises a novel arrangement of a plurality of coating gates, whereby the flow of material, such as sand, gravel, crushed rock and the like, may be arrested or controlled. It consists of a closed chute having an extended flange on the sides, a gate flexibly connected to form a continuation of said bottom, or to be turned up transversely thereto, a second gate adapted to close the mouth of the chute and having arms or connections pivoted to the sides of the chute and about which pivots said arms are turnable to open or close the gate.

Progressive Combustion.

Some years ago engineers conceived the idea that economical combustion of coal could only be obtained by progressively advancing the coal in the furnace so that each component of the coal would be completely consumed on reaching that portion of the furnace which was adapted and designed for its proper combustion. Working on this idea with hand-fired furnaces, they placed the fresh fuel just inside the furnace door, where the volatile gases were released and the coal was coked. The coke was then pushed back to finish its combustion and form an incandescent fire, over which passed the volatile gases from the fresh coal, to be repeated when fresh fuel was fired. Despite the fact that much of the benefit derived from this method of firing was neutralized by the inrush of cold air through furnace doors necessarily opened for firing and cleaning—a loss inevitable when hand-fired furnaces are used; nevertheless, it was demonstrated that perfect application of the principle of progressive combustion would result in the complete utilization of all the heat units in the coal without any losses due to partial combustion. Since this discovery, engineers have endeavored to improve furnace settings and methods of firing coal, in order that the conditions for progressive combustion might be produced.

Since hand firing can not furnish a uniform and constant supply of fuel with requisite air, nor maintain a uniform furnace temperature, the endeavors to secure a progressive combustion have evolved a variety of stokers. Some are planned to feed the coal continuously upon inclined grate bars, over which the coal is designed to travel by gravitation or agitation.

Another form of stoker is built to force the fuel up into the furnace through a narrow trough, along the upper edges of which air under pressure is blown into the fire which piles over the trough and concentrates a blowpipe effect upon portions of the boiler and setting; but this is not deemed entirely satisfactory in the case of bituminous coals. A type of automatic stoker, originating in England, furnished the basis of another device for obtaining progressive combustion. It embodied a moving endless chain mounted on a frame, with provision for the continuous and uniform feeding of coal into the furnace, both fuel and grate traveling together. The operations of feeding the coal into the furnace, carrying it through the progressive stages of combustion, removing the ashes and clinkers, and maintaining a clean grate surface and free supply of air, were to a

Green Traveling Link Grate.

certain extent automatically performed. Being largely independent of the quality of fuel, this stoker successfully used the poorest and cheapest coals. In its original form this chain grate stoker had its limitations. The cast iron frame was brought so close to the surface of the fire as to be quickly warped or cracked by the heat. Short links were closely strung upon round rods, but difficult to remove when a link was to be replaced, and unavoidably reduced the air spaces, and so prevented the proper supply of air to the furnace. In its original construction, the length of the chain grate upon which the fuel burned was too short for complete combustion, there was inadequate protection against leakage at the bridge wall, and the regulating gate was imperfectly protected against the furnace heat. An igniting arch across the furnace seems necessary in this type as a heat

deflector to ignite the coal as it passes from under the grate, and the only form then known was a curved arch, which, to be effective, had to be built with the least possible crown, resulting, except in very narrow furnaces, in weak, unstable construction, and unable to withstand hard service without frequent and expensive renewals. These defects limited chain grates in size and capacity and proper ratio of grate surface to heating surface could not be obtained. The Green Engineering Co. of Chicago have a traveling link grate, illustrated herewith, in which the side girders of the frame are entirely removed from the furnace fire and increased uniform air supply thus provided. Thin staggered links of great depth and long overhang shear any clinker which may lodge against the bridge wall, while at the same time they completely clear the ash from all the air spaces of the chain at every turn around the rear and front sprockets. The illustration shows one of these automatic stoking devices in operation.

Iron Ore on the McCloud River, California. (See page 294.)

IN Del Norte, Cal., mining notes this week, on page 299, is an account of ocean sands at Gold Bluff and the wash and swirl that make gold saving partially profitable at times. The same thing on a much larger scale exists at Nome, Alaska, where from the sea are swept great quantities of gold sands, locally assumed to be originally resultant from the glaciers comparatively near that have slowly cut their way to the sea. Taking the rein off the scientific side, and giving play to the imagination, what a gigantic quartz crusher this glacier makes as it grinds down the gold quartz, a huge machine beside which the biggest crusher devised by humans is but a toy; a herculean machine that tears off the tops of the mountains, grinds them to powder, carries the "pulp" a hundred miles with no regard to size of sluice plates, and makes the ocean itself a huge accessory to sift and toss it on the shore.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Green Traveling Link Grate; Iron Ore on the McCloud River, Cal., 290. The G. E. Hose Couplings, 298. Mining and Metallurgical Patents, 298.
 EDITORIAL.—Of Great Practical Value, 291.
 MINING SUMMARY.—299-300-301-302.
 LATEST MARKET REPORTS.—17.
 MISCELLANEOUS.—Progressive Combustion, 290. Concentrates, 292. California Miners' Association, 293. Steam Plant for Gold Mines; Undeveloped Iron Deposits, 294. Some Practical Mine Pointers, 295. Expenditure on Unpatented Claims; Imperial Cyanide Method; A Modern Gold Mill; The G. E. Hose Couplings, 296. A Butte Miners' Opinion; Improved Cathode Plate; The Mineral Crest, or the Hydrostatic Level Attained by the Ore-Depositing Solutions in Certain Mining Districts of the Great Salt Lake Basin, 297. Mining and Metallurgical Patents; A Georgia Stamp Mill, 298. Personal; Commercial Paragraphs; Catalogues Received; New Patents; Copper Statistics; Notices of Recent Patents, 303.

Of Great Practical Value.

In last week's issue was given the suggestive titles of 100 topics of practical interest to mining men, each of which might be made the base of a valuable article thereon. Along the same lines it might be further suggested that in these columns is weekly found just that kind of articles written by practical men, and of great value to progressive workers in every department of mining.

It may be in order to cite some original articles which have recently appeared in this paper:

"Notes on Ore Dressing," by A. W. Warwick of Prescott, Arizona; "Construction of an Upraise," by F. Sletcher of California; "Quicksilver Recovery from Greasy Refuse," by D. B. Huntley of Idaho; "The Switzerland of Colorado," by T. A. Rickard of Colorado; "Bookkeeping for Mines," by S. I. Hallett of Colorado; "On the Concentration of Ores by the Use of Water," by Chas. Taylor of Arizona; "Dredging for Gold," by Theo. F. Van Wagenen of Idaho; "Gold Mining and Milling," by H. V. Croll of Montana; "Outcrops and Croppings," by J. P. Wallace of Oregon; "Treating Refractory Ore," by S. E. Bretherton of New Mexico; "Deadly Gas in Mines," by A. T. Heydon of California; "Cyaniding at El Dorado Canyon," by A. E. Vandercook of Nevada; "Iron Mines of Southern California," by C. H. Hubbs of California; "Masonry Dams and Retaining Walls," by G. T. Pardoe of Sussex, England; "A Door Closed to Miners," by A. H. Ricketts of California; "The California Copper Co.," by F. F. Sharpless of Massachusetts; "Wet Crushing and Cyaniding Siliceous Ores of the Black Hills," by Jno. M. Henton of South Dakota; "Testing Gold Dredging Ground," by R. M. Downie of Pennsylvania; "The California Oil Industry," by E. H. Rydall of California; "The Divining Rod," by David Kirkwood of British Columbia; "Successful Precipitations from Solutions Weak in Cyanide," by Matt W. Alderson of Montana; "Cheap Mining and Milling at the Spanish Mine," by H. F. Brown of Illinois; "Two Curious Lakes of Nevada," by W. H. Fairbanks of California; "Copper Mining at Placeritas de Nacosari, Sonora, Mexico," by H. B. Layton of Arizona; "Sinking vs. Tunnelling in Development Work," by J. M. Johnson of Washington; "Antimony in Austin, Nevada," by W. C. Gayhart of Nevada; "Use of the 'Baby' Air Drill," by H. P. Stow of California; "Mount Whitney, Cal., Electrical Transmission," by H. G. Parsons of California; "Amalgamation of Metals, Normal and Electrolytic," by J. H. Jory of California; "Southern Oregon Placer Conditions," by Theo. F. Van Wagenen of Idaho; "Some Observations on the Practice of the Cyanide Process at Mercur, Utah," by Wm. Magenau of Utah; "Cyanide Plant at Weaver, Ariz.," by D. E. Bigelow of Arizona; "Small Mine Concentration," by S. I. Hallett of Colorado; "How to Make a Clinometer," by A. S. Cooper of California; "The Atlin Gold Fields," by J. H. Brownlee of British Columbia; "The Joplin Zinc District of Southwestern Missouri," by J. H. Steele of Colorado;

"The 300-Stamp Mill on Douglas Island," by Henry Watson of Alaska; "Outlines of Structural Geology," by J. A. Edman of California; "Matte Smelting Plant at Campo Seco," by Edw. J. Fowler of California; "Gold Dredging at Oroville, Cal.," by H. G. Parsons of California; "Ozokerite," by Dr. J. Ohly of Colorado; "Terlingua Quicksilver Mining District," by H. W. Turner of the U. S. G. S.; "Empire Mines, Past and Present," by Geo. W. Starr of California; "Stamp Mill Practice at Octave, Ariz.," by D. E. Bigelow of California; "Uranium and Its Ores," by Dr. J. Ohly of Colorado; "Oldest Gold Mining Camp," by T. Van Wagenen, now of South Africa; "Mine Blasting," by L. J. Safley of Arizona; "Mill Practice in Cyaniding Siliceous Ores of the Black Hills," by John M. Henton of South Dakota; "Keeping and Indexing Notes," by E. A. H. Tays of Mexico; "California Crude Petroleum as a Fuel," by E. H. Denicke of California; "Estimation of Copper in Ores by Cyanide Process," by O. H. Packer of California; "Republic, Wash., Sampling and Reduction Works," by D. C. Jackling of Colorado; "Catching Black Sand," by John D. King of New Mexico; "Boise Mining District," by Robt. Nye of Idaho; "Copper Deposits of Southwestern Nevada," by E. McCormick of Nevada; "Machine Mine Rock Drills on the Pacific Coast," by A. E. Chodzko of California; "Characteristics of California Petroleum," by A. S. Cooper of California; "Oil Fields of Kern County, Cal.," by H. G. Parsons of California; "Successful Working of Cement Gravels," by G. E. Bailey of California; "Cross Shaft, Angels, Cal.," by S. A. Hoffman of California; "Protecting Shaft Timbers When Blasting," by J. P. Munger of California; "The German Meniecke," by S. I. Hallett of Colorado; "Use of Hot Blast in Smelting," by S. E. Bretherton of Colorado; "West Australia Mining Laws," by Geo. Hope of California; "A California Gold Dredger," by R. H. Postlethwaite of California; "Suggestions on Inland Gold Dredging," by P. R. Eteson of California; "New Methods for the Extraction of Copper and Zinc," by Dr. J. Ohly of Colorado; "Orthodox and Wildcat Oil Propositions," by A. S. Cooper of California; "Ralston Divide, Placer County, Cal.," by A. Bordeaux of California; "Gravel in Snake River Gravel Bars," by W. H. Washburn of Oregon; "Treatment of Flat Hoisting Cables," by A. E. Johnson of Montana; "High Pressure Rotary Pumps," by Jno. Richards of California; "Leaching of Copper Ores," by Dr. J. Ohly of Colorado; "Mines of Esmeralda County, Nev.," by H. W. Turner of U. S. G. S.; "Stamp Mill Foundations," by A. W. Warwick of Colorado; "Power Required by Stamps," by the same author; "Mining in Korea," by W. G. Anderson Jr. of California; "Petroleum Oil Pipe Lines," by A. S. Cooper of California; "Manufacture of Uranium Compounds," by Dr. J. Ohly of Colorado; "Wet Process Copper Extraction," by W. A. Scott of Arizona; "Oil Engines in Mining and Milling," by A. W. Warwick of Colorado; "Permanganate Process," by N. Norman of California; "Power Required by Stamps," by H. Louis, Newcastle, England; "Notes on Tepic, Mexico," by Clarence King of California; "Granite Bi-Metallic Mill," by A. D. Moffat of Montana; "Calculating Compressed Air Pressure," by D. E. Bigelow of California; "The Bequerel Ray," by Edw. Booth of California; "Tamping in Blasting," by R. H. Bemis of Montana; "Dorcas Pneumatic Cyanide Mill," by E. F. Gropello of Colorado; "Tonopah," by S. A. Knapp of Nevada; "Use of Tamping in Blasting," by C. L. Lang of California; "Elements in Design of Roll Crushing Plants," by Jesse Scobey of Colorado; "Rare Minerals in Gold Quartz Veins of Eastern Oregon," by Waldemar Lindgren of the U. S. G. S.; "Home for Prospectors," by N. E. Linsley of Washington; "Forest Endowment of Pacific Slope," by J. G. Lemmon of California; "Leadville Pumping Practice," by A. W. Warwick of Colorado; "Cyaniding Complex Gold Ores," by F. H. Probert of California; "Electrolytic Precipitation From Cyanide Solutions," by J. H. Jory of California; "Genesis of Ore Deposits," by M. W. Alderson of Montana; "Smelting Siliceous Lead-Copper Carbonates," by A. Hauman of Mexico; "Sulphide Ore Problem," by J. W. Worsey, St. Helens, England; "Method of Saving Fine Gold of Snake river," by Wm. H. Washburn of Idaho; "Automatic Sampler, Aspen, Colo.," by S. I. Hallett of Colorado; "Cooling Water

by Compressed Air," by A. E. Chodzko of California; "Loss of Pressure by Friction of Water in Pipes," by D. E. Bigelow of California; "Comparison of Fire with Water for Concentration," by S. E. Bretherton of Colorado; "Vein Structure," by W. H. Weed of Montana; "Sampling Mill Work," by Jesse Scobey of Colorado; "Laboratory Amalgamating Device," by H. S. Guess of Canada; "Purchase of Mining Machinery," by F. F. Snyder of Illinois; "Genesis of Ore Deposits," by E. A. H. Tays of Mexico; "Portland Cement Manufacture on the Pacific Coast," by A. H. Cederberg of Washington; "Late Gold Dredging Practice," by R. L. Montagu of California; "Wet Crushing Cyanide Mill in the Black Hills," by E. Sawyer of South Dakota; "Placers of Cariboo, B. C.," by R. H. Campbell of British Columbia; "Modern Method of Finding New Elements," by Edw. Booth of California; "Standard Assay Certificate Form," by R. L. Dunn of California; "Water Conduit for Power Plant," by L. Waggoner of California; "Mine Electric Bell System," by E. M. Kirk of Colorado; "New Method of Quicksilver Extraction," by J. H. Jory of California; "Small Things in Mining," by W. H. Storms of California; "The Mind of the Engineer," by C. H. Fitch of Illinois; "Solving the Fuel Problem in Arizona Mines," by J. H. Wood of Arizona; "Cyaniding Silver-Bearing Tailings," by J. F. Terry of South Dakota; "Corundum in Montana," by J. A. Edman of California; "Benton Mills Dam," by C. C. Derby of California; "Gases in a Quicksilver Mine," by P. Rearden of Wyoming; "Meadow Lake Mining District," by C. W. Raymond of California; "Treatment of Refractory Silver and Gold Ores at the Mill," by R. C. Campbell-Johnson of British Columbia; "Driving Tunnels by Hand," by J. H. Schockley of Colorado; "Thunder Mountain," by Robt. Bell of Idaho; "Edges of Drill Bits," by C. Shachman of Arizona; "Workings of a Manager's Mind," by C. H. Fitch of Illinois; "A New Mexican Mining District," by E. B. Van Osdel of Washington; "Realizing on Concentrates When Shipping is Impracticable," by E. A. H. Tays of Mexico; "Testing Cyanide Solutions by Silver Nitrate," by B. W. Begeer of Colorado; "Tests of Cast Iron Pipe," by R. K. Crokey of Lorraine; "Stateline Mining District," by G. H. Smith of Utah; "Screen vs. Hydraulic Sizing," by S. I. Hallett of Colorado; "The Nome Gold Fields," by O. Halla of Alaska; "Silver-Lead Mines of Darwin," by A. B. Chittenden of California; "Ultimate Velocity of Gases," by H. D. Dibble of Utah; "Use of Petroleum for Power Purposes," by W. Forstner of California; "Electric and Compressed Air Mining Locomotives," by F. C. Perkins of New York; "Mining as a Profession," by J. B. Balcomb of California; "Henry Train Lighting System," by C. F. Elliott of Ohio; "Smelting Arsenical Ores in Blast Furnaces," by Herbert Lang of California; "Placer Mining Kinks," by C. P. Richardson of Idaho; "Stave and Binder Flume," by Guy Sterling of Utah; "Water Purification for Domestic Use," by F. Rigaud of California; "Assaying Low-Grade Silver Ores," by C. M. Fassett of Washington; "Experiments with Concentration," by W. H. Washburn of Idaho; "Leaching Sulphide Copper Ores," by J. A. Fleming of Arizona; "Power Required to Deposit Copper by Electricity," by T. K. Wilkinson of Colorado; "Compressed Air for Mining from Electric Power," by J. B. Tregloan of California; "Bullion Retorting and Melting Furnace," by E. L. Ballou of California; "Small Smelting Works," by Herbert Lang of California; "Stamp Battery Block Foundation in Soft Ground," by W. H. Washburn of Idaho; "Crude Oil for Tempering Rock Drills," by B. Hastings of Arizona; "Acid Plant at Black Warrior," by E. H. Benson of Arizona; "Concentrative Experiments on Antimonial Silver Ores," by C. M. Fassett of Washington; "Made Ground," by C. H. Fitch of Illinois; "American Copper Mines," by H. J. Bond of New Jersey; "Drift Mines of El Dorado County," by G. W. Kimble of California; "New Form of Cupel," by Jos. Voyle of Oregon; "Reformed Copper Ores," by J. C. Goodwin of Arizona; "Hints to Prospectors," by W. J. Adams of California; "Smelting Charges," by C. P. Crawford of New Mexico; "Oxidizing Agents in Cyanide Mill Solutions," by J. F. Terry of Mexico; "Evolution of the Stamp Mill," by Irving M. Scott of California; "Shaft Sinking," by C. K. Colvin of Colorado; "Silver King Concentrating Mill," by J. H. Steele of Utah; "Details of Cyaniding," by E. Gayford o

North Carolina; "Mineral Wealth of China," by F. R. Wardle of California; "Finer Issues of Mining," by C. H. Fitch of Illinois; "Width of Sluice Plates," by W. J. Adams of California; "Smelting on Vancouver Island," by W. M. Brewer of British Columbia.

The man who reads the above list understandingly will see that those articles cover nearly everything in mining and metallurgy. The man who had an up-to-date treatise on those subjects would think he had a good library on such matters. The list and the names of the authors are merely indicative of the scope of the paper that presents such an amount of information to its readers, this being but one of the features that make this paper so popular among mining men everywhere.

And it is to be noted that there is in this list not one that is merely an abstract theory or an academic notion. Those articles were all written by men who daily do the things they talk about, and who wrote from the abundance of their experience. It is that which makes such articles of great practical value.

Concentrates.

GOOD DYNAMITE will not have moisture more than 1%.

THE highest mountain in United States territory is Mt. McKinley, Alaska, 20,460 feet.

MINERS' CANDLES cost \$5 per box in Spokane, Wash., and \$6.25 per box in Sandoz, B. C.

SODIUM CHLORIDE and copper sulphate are used in chloridizing silver sulphurets or sulphides in the pan.

DETERMINATION of the specific gravity of any solid or liquid should be made at a temperature of 60° F., or 15.5° C.

THE highest point ever reached by a railroad is Galera tunnel, on the Oroya railroad, Peru, S. A.—15,665 feet above the sea.

ON any unpatented mining claim, located since Jan. 1, 1901, regardless of how much work was done on it in 1901, there must be \$100 worth of work or improvements in 1902 to hold it.

A TANK 5 feet 6 inches square would hold 226.28 U. S. gallons for every foot in depth. A round tank 5 feet 6 inches in diameter would hold 177.72 U. S. gallons for every foot of depth.

CHLORATE OF POTASH is explosive by itself. If a bead of chlorate be suddenly heated to a high temperature by passing an electric current through a loop of platinum wire in which the bead is held an explosion will result.

IN ordinary temperatures and conditions, amalgam from a hydraulic sluice would run about 35% gold and 65% quicksilver; of such amalgam, when retorted, 100 pounds might yield about 58 pounds quicksilver—a loss of about 10%.

THERE are two kinds or classes of mining experts—buyers' experts and sellers' experts. This in addition to or on the side, unaffected the ordinary expert who is not for the buyer or the seller. The buyers' expert is a bear, the sellers' expert a bull. It is not the ordinary trend of a man's nature that places him in either position, but strictly business reasons.

ABANDONMENT and forfeiture of an unpatented mining claim are two very different things. One can abandon a mining claim voluntarily, but he can forfeit it only by failure to comply with required legal provisions for holding it. Forfeiture is easier proved than abandonment. Any public mineral land which has been forfeited or abandoned can be re-entered by the same or another locator.

IN the electric recovery of pure tin from waste tin cuttings the tin is recovered by electrolysis, and the clean iron either sold as scrap or converted into green coppers, which may be further converted into red oxide and Nordhausen sulphuric acid. The electrolyte in the stripping tanks is a 1½% solution of commercial hydrochloric acid, to which is added a small quantity of oil of vitrol.

TELLURIDE ORES of Kalgoorlie, West Australia, are of a somewhat different nature to those at Cripple Creek, Colo. They are of very much less specific gravity and are found somewhat in conjunction with hornblende and conglomerate schistose formations. Metallurgists have given the name of kalgoorlite to the tellurium found there. This metal contains in many places an almost pure tellurium of gold.

WITH an assayer's certificate of the assay value of ore, concentrates and tailings, to know how many tons had been put into one, if from the assay value per ton of ore and of headings there he extracted the assay value per ton of tailings, and the lesser remainder divided by the greater, the quotient represents the "number of tons put into one." Ore containing free gold amalgamated in batteries or on plates should have the sample for ore assay taken from the pulp delivered to the concentrators. The assay value of the original ore may then be found by dividing the value of the amalgam by the number of tons

crushed, and adding the result to that found by the assay of the pulp going to the concentrators. This would give about as accurate a result as sampling from the rock breaker.

A METALLIC ARSENATE in roasting is decomposed by the joint action of sulphuric anhydride and a weak reducing agent, like sulphur, iron or copper, the former decomposing the arsenate and the latter reducing the stable arsenic oxide to the volatile arsenious oxide. The presence of a powerful deoxidizing agent like charcoal is liable to reduce the sulphuric anhydride and prevent its decomposing metallic arsenate. The probable reason why the arsenic is not wholly expelled toward the end of the roast is perhaps due to the fact that the ore was not ground sufficiently fine for the sulphuric anhydride to reach the centers of the particles of ore.

WHILE garnet as an abrasive material is in commercial use, yet the garnet properties mentioned in the Massachusetts inquiry would not seem to be an encouraging commercial proposition, as, apart from emery and corundum, the artificial production of corundum at low price for abrasive purposes would seem to work against the suggested development of a garnet property. The manufacturers of corundum produced 3,838,175 pounds in 1901, valued at \$345,435, as compared with a production of 2,401,405 pounds the previous year, valued at \$216,138. Of garnet the 1901 production was 4713 tons, valued at \$159,238. The 1901 production of corundum and emery was 4305 tons, valued at \$146,040.

UNDER a recent ruling the Secretary of the Interior has held that mining claims which lie so contiguous to one another that taken altogether they form one body of mineral land, are all properly developed by a tunnel through which it is contemplated to work the entire property, and that a claim "which is a member of such a group does not cease to be a beneficiary of such work or improvement in proceedings for patent simply because and for reasons sufficient to the owner of the group, such claim or location is not embraced in the first proceedings for patent to one or more locations in the group in which part of such work or improvement is duly credited under Section 2325. It is immaterial so far as receiving credit under that section for its due share of the value of the work is concerned when proceedings for patent to such mining claims or locations are commenced by such owner, or whether the proceedings embrace one or more of the locations. These are matters for the owner. His right to have the due share of work or improvements, or other value credited under Section 2325 to the several members of the group of claims is not in any way dependent upon his embracing them all in any one application and entry. If he complies with the mining laws in other respects he may apply for and enter them singly or in pairs, or otherwise, at his option, without in any way impairing his rights."

BETTEL'S PROCESS is the electrical precipitation of gold or silver on zinc shavings, using a coated lead anode, the current being of such volume that a tension is produced higher than the back electro-motive force between zinc and oxygen in a cyanide solution of whatever strength may be used. The zinc does not appreciably dissolve; and the gold, once precipitated, never redissolves. In the boxes, solution can be put through continuously, if required, for three months without attention, provided a constant current be maintained and the solutions entering the boxes are filtered. If zinc be present in the solution it is precipitated as a flocculent sponge carrying some gold; a filter interposed between the boxes and the sump is therefore occasionally required. The zinc, when taken from the boxes, has a jet black appearance, and is in condition to transfer to extractor boxes of the sands plant, using ordinary zinc precipitation. The Betty or zinc-lead process consists of the ordinary zinc process, the zinc being lead-covered by dipping in strong acetate of lead solution and a strong solution allowed to flow into the head of the box to promote electrical activity of the zinc-lead couple. The zinc-lead couple retains its activity for a time, varying with the impurities contained in the solution. In solutions saturated with zinc ferrocyanide the process may only be effective for forty-eight hours, unless a heavy dose of cyanide is introduced. At other times it may go nearly a month without the effluent being higher than nine grains of fine gold per ton. The oxidized zinc with adhering oxides and ferrocyanides is transferred to the ordinary zinc extractor boxes, where the coating is removed by and dissolved in the strong cyanide solution at the expense of the precipitation for the time being.

T. A. EDISON'S magnetic milling process is a metallurgical fact and a purely scientific success, but not from the commercial point of view. The most recent described experiments with his device were at Baham, London, England, where in a small building were arranged the series of magnetic separators on which the process depends. The ore was first crushed to a gunpowder-like form by machinery, capable of reducing blocks of ore weighing five tons. This powder, consisting of magnetite, hematite and earthy matter, was exhibited, and it was shown by preliminary experiment how the ordinary magnet, while snatching up the magnetic particles with great force, left the hematite element practically uninfluenced. Then the first step in the separation was proceeded with. The crude powder was dropped in bucketsful through a separator containing magnets on the ordinary principle, and the magnetite, deflected by the magnetic action, was seen to pass in a steady stream into one receptacle, while the dross, or

gangue, and the hematite dropped into another. Then remained the more difficult problem of the separation of the hematite from the earthy dross. The mixture remaining after the first process was passed through the second separator contained magnets on the new Edison principle. The magnets at once attracted the hematite metallic particles, hitherto considered practically unsuspensible, and, after collecting in a brush-like formation, they dropped steadily into the receiver, while the earthy matter found its way out of the machine by another exit. The process continued with absolute continuity and great rapidity, and there was no hitch of any kind. A second and third milling extracted what little metallic matter remained, leaving only sand and other useless detritus. The process eliminated phosphorus, and the separated metal appeared bright and pure, only requiring to be formed into briquettes to be ready for the furnace.

IT is not uncommon to see large sums spent in hunting ore along the edges of some worked-out ore shoot. In other cases the barren vein areas between shoots is explored by the same close and expensive network of shafts, winzes and levels that would be used within the areas of the shoots themselves. Since shoots stand up and down in a vein, there is more chance of striking one by horizontal than by vertical workings. Incidentally the former are much cheaper. Notwithstanding this, the chief hopes in development work are apt to center on the shafts and winzes, because these gain depth. The old and never-dying delusion that mines always improve with depth is partly responsible for this. As a matter of fact mines improve when any working gets into an ore shoot. But now and then some shaft headed for the earth's center chances to run into a shoot on its downward slope. The same shoot might have been found with little delay or expense by a short level from the shaft while it was shallow. Indeed, it may come to the surface and a little skillful prospecting expose it there at the beginning of operations. Nevertheless such strikes are always heralded as proof of the depth theory. When mining in fissure veins a part of the development work is often wasted by being "run off the vein." The filled and cemented fissure which constitutes a vein of this class is not often a simple, clean-cut break. Like any other fracture in a solid mass, it has branches, crossings, side bows and parallel crevices in every conceivable form. These may be distributed through a width of 20 to 100 feet and are more or less connected by interlacing crevices. It is not easy and is sometimes impossible at first sight to distinguish the principal ore-bearing fracture or "main vein" from the others. At every split there is a chance of following the wrong clew and the sum total of such possible errors in a single mine is evident. The difficulties are increased by the fact that an ore shoot frequently jumps from one crevice to another and mine levels, therefore, pass by it. In addition to the difficulties of identifying the main crevice of one vein, are those which come from the existence of other veins close by. Every time the vein must be reached anew by a lower shaft, crosscut or tunnel, there is danger of mistake. There are no tags on the veins and a large expenditure of good money on the wrong one is a familiar sight.

THE so-called regeneration of burnt steel is most simply accomplished in the following manner: Heat the steel several times to a dark red, and quench after each heating in hot water. The steel finally recovers its former qualities. The first heating and quenching has the strongest effect, which gradually becomes weaker until after the fourth or fifth treatment the steel is affected no longer. From this it is evident that three or four temperings are usually sufficient. By examining the fracture surface of steel thus regenerated it will be found that its grain has become as fine as it was before burning; in fact, its structure is identical with that of similar steel hardened, but which had not suffered any previous burning. It is, however, always to be understood that the above mentioned chemical change of the steel in regard to its carbon contents has not taken place simultaneously with its burning. In this case the simple tempering method is of no avail, and the steel has to be subjected to a different treatment, according to the circumstances. If the steel has absorbed too much carbon, it should be heated slowly, allowing free access of air; if it has lost too much carbon, it has to be recarbonized before hardening. This is accomplished by putting the tools or other steel articles to be treated into boxes of sheet iron or crucibles and imbedding them singly or collectively in powdered bone or charcoal. After the boxes or crucibles have been closed tightly, these, together with the contents, are heated for about one hour, when the articles are taken out and tempered in water. Frequently heating in closed vessels is dispensed with, and simple hardening means applied to the articles. In this case, for instance, ferrocyanide of potash can be sprinkled on the articles after they have been heated to a brown red, and they are then tempered in water. A number of means for regenerating burnt steel are in use, and either one or the other is recommended by their respective champions. Some favor pure water, but others prefer stronger mixtures. Two recipes are given: (1) Ten parts of resin, five parts of fish oil, three parts of mutton fat. When employing this mixture the steel is heated to a dark red and quenched in the molten liquid, after which it can be tempered in the usual manner. (2) Ten parts of mutton fat, ten parts of linseed oil, one part of lamp black. This mixture is melted and the steel manipulated in about the same way.

California Miners' Association.

The eleventh annual convention of the California Miners' Association met at Golden Gate Hall, San Francisco, on the 17th inst. Speeches of welcome, letters from State officials, and President E. C. Voorheis' address occupied the morning session. Among other things he said:

"The officers of this Association have been untiring in their efforts to secure the passage through Congress of what is known as the mineral lands bill. All of our Representatives in Congress have worked faithfully and hard for this bill, but so far we have failed to secure its passage. We will keep up the good work and try, if possible, to overcome the objections to the bill. If we fail to do that, then we must try to pass it in spite of the objections.

"We are in favor of some measure being taken by the general government toward the conservation and the storage of flood waters, which, if it could be accomplished, would be of incalculable value to the farmers, as well as to the miners, of the entire State.

"The mineral production of the United States is reaching such vast proportions that it is only a matter of short time when the Government of the United States will be bound to recognize our claims and give us a special Department of Mines and Mining, with a Cabinet officer at its head. If we could induce the Representatives from other States where mining is carried on extensively, whether it is gold, silver, copper, coal, iron, petroleum or any other mineral substance taken from the earth, to join with us and ask this recognition, I think we would be successful in having a Department of Mines and Mining established.

"Look at our vast stores of oil, mountains of timber, building stone, iron, copper, gold and silver—in fact, nearly all of the minerals that are useful to man. We are here and all we have to do is to embrace the opportunity which is now offered us, and become the second pioneers and carry on the work laid out for us by the hardy forty-niners who only came here to dig a fortune out of the earth and then return to their homes to enjoy the remainder of their days.

"If they could return in fifty years from now and see California, the greatest State in the Union, with thousands of ships coming and going through the Golden Gate, railroads running from one end of the State to the other, factories of all kinds located over the State, storage reservoirs built all through the hills and mountains to take care of the flood waters in the winter and to be used for irrigation in the summer, the mountain streams all harnessed to electric generators, thus easily distributing cheap power to the factories and farms, then, indeed, they could well be proud that they laid the foundations for this vast empire."

President Voorheis also referred to the prominent part played by the California Miners' Association in securing the passage by Congress of the act authorizing hydraulic mining under certain restrictions. Since that Act was passed, 469 permits have been issued to mine and employment to several thousand has resulted, while great stores of gold have been added to the world's wealth. President Voorheis also referred to the work of the Association to secure restraining barriers in the principal streams of California and to the beginning of work on the barriers in the Yuba river to cost \$800,000.

B. I. Wheeler, president of the University of California, gave an address on the advantages of college training and cited individual instances of the world's demand for trained men in all departments of mining and metallurgy. Of the mining college he said:

"The course is so planned that the mining student is thoroughly grounded in the scientific bases of his profession. He has been taught how to use mining machinery. He has gained an insight into the actual conditions of the life of the mining engineer and of the miner who works with his hands. He has been shown how to go to work on the solution of the infinitely involved problems which will continually arise throughout his professional life.

"The graduates of the College of Mining, as was to have been expected, have scattered far and wide over the world. In South Africa the number of mining engineers trained at the University of California exceeds the number from any two other American universities. Others of our graduates have scattered throughout Central and South America, in Australia and Tasmania, in China and Japan, in Mexico and Alaska, and in every mining region in North America."

"Machine Drilling by Compressed Air" was the subject of a practical article from a working miner's standpoint by H. P. Stow, manager Gold Bank mine, Forbestown, Cal., followed by C. T. Deane, of the California Miners' Association, who read a paper on the oil fields of California. He stated that there are 2500 producing oil wells in California, which are in fourteen districts. The production of petroleum in California was 4,000,000 barrels in 1900; 8,000,000 in barrels in 1901; would be 12,000,000 barrels in 1902 and probably 20,000,000 in 1903. By 1905 he thought the total petroleum output of the State would amount annually to 50,000,000 barrels.

Alfred von der Ropp, superintendent of the Selby

Smelting & Lead Co., Selby, Cal., read a valuable paper on petroleum as a fuel, it being his experience that it afforded a 50% saving on smelting operations. He made manifest the necessity of expert construction and handling of the plant, and that "fuel oil" as a generic term was too elastic, the crude petroleum being the requisite specific substance for that kind of fuel.

The second day's proceedings were signalized by the discussion of the Polar Star case in Placer county, Cal., it being decided that notice of appeal be given from the decision of the Superior Court.

J. B. Tregloan read a paper on "Electric Power for General Mining Purposes," in which he said that electricity at \$6.50 a thousand H. P. per month about equals water at 20 cents an inch under 500 feet fall and that applied direct it costs approximately half as much to operate machinery by electricity at \$6.50 per thousand H. P. per month as by steam engines with wood at \$6 a cord at the furnace; that \$17 worth of fuel oil at \$1.50 per barrel would do the same work as \$24 worth of pine wood, at \$6 a cord, for hoisting purposes; electricity at \$6.50 per H. P. per month would save \$150 a month over water at 20 cents an inch under a 135-foot fall. At the Oneida mine, in Amador county, where pumping is done by electricity, 200 gallons of water a minute can be raised 1300 feet vertically through a 6-inch pipe, using 100 H. P. electricity, at a cost of \$3 40 for four and a half hours' duration. Additional H. P. could be obtained by using twenty-four pounds of coal for reheating purposes. It takes from 96 to 120 pounds of good coal to get a H. P. from steam for twenty-four hours.

W. C. Ralston read a paper on "Flume Construction," giving the details and cost of the upper two miles of a 4-mile flume in Calaveras county, 10,462 feet long, 8x4 feet, huilt from the lower end up. "Generally," said the speaker, "it is considered cheaper to begin at the head of the flume and construct down stream, floating the timber in the flume. I decided this was not economical because in the excessive heat which prevails in our section during the fall our lumber would have checked badly. It would have required the handling of the lumber more often. Men would have to walk in the water or complete the flume as they went along, even to the walking board. A new idea to most of us was suggested by the foreman. A low truck was made with axles wide enough to run on the outside stringers, and with this mode we could run our lumber out and keep a long way ahead with our bents. We immediately laid the floor and used it as a wagon road to haul our lumber with a single horse in shafts, the wheels of the trucks being 10 inches wide, made of a cut of a tree, and with two 4x2-inch iron tires. It will be seen from the list of lumber used that our sides were of 1½-inch plank. That is too light, as it should have been made of 2-inch plank. The 1½-inch plank springs away from the hatten between the posts. If anyone contemplates building a large flume of this description, it would pay to make a contract with the sawmill to have all your lumber cut and squared to exact lengths, except the bottom plank, on account of the bends, to have the stringers sized up to the proper thickness and to have all the caps gained."

A. M. Hunt followed with a paper on "Petroleum Oil as a Fuel." He maintained that with crude petroleum as a fuel motive power can be produced more cheaply on the shore of San Francisco bay than by the transmission of electric power 200 miles from sources of water power in the mountains.

"The amount of copper wire," said Mr. Hunt, "required to transmit 50,000 H. P. a distance of 200 miles at 10% loss under normal conditions is approximately 16,000,000 pounds. It would be absolutely necessary to erect at least two distinct and separate transmission lines in order to guarantee continuous operation. I have figured on using a form of tower construction that would make stability the first item of consideration, and would give as my estimate of the cost of such lines \$3,500,000, which would cover cost of material and erection, rights of way and other things.

"I will take first the cost for horse power when it is taken twenty-four hours daily for 365 days a year. In the case of the water-power plant it is immaterial what the number of hours may be. The cost of the operation per horse power of a plant installed remains the same, as the operating cost is a lump sum, which does not vary with the number of hours use is made of the current. I have assumed for the purpose of calculation that interest, depreciation, taxes and all other charges against the pole lines will be covered by 12% on the investment therein, and I think that this is in no way excessive. The total charge, therefore, against the pole line would be \$424,000 yearly, or the sum of \$8.40 per horse power per year. Under similar circumstances operating the steam plant twenty-four hours daily and 365 days a year the output of the steam plant per horse power installed would be \$19.68, showing a very great advantage for the water power.

"There is little or no probability of the cost of transmitted power being reduced. The only way in which the charge under consideration in the present instance could be lowered would be by increasing the voltage at which the line is operated. As against transmitted electric power brought from the mountains and steam power generated on the hay by fuel

oil, the steam plant has the advantage and will have."

"The Preservation of the Forests" was the title of a paper by A. D. Foote, who took strong position in advocacy of measures to prevent the destruction of the forests by fire:

"All else of forestry can wait. Regulation of cutting; deposition of brush; replanting; reservations for the conservation of water; all the work of modern intelligent forestry will be of enormous value in keeping up our forests, but our present work is the prevention of fires. It is proposed that the California Miners' Association take the initiative in the prevention of forest fires in this State. At the proper time a resolution will be offered for your consideration embodying the idea that your committee on legislation shall prepare a bill and urge its passage through the next Legislature, which shall appropriate \$50,000, or whatever sum the committee may think necessary, for the purpose of paying a fire patrol to put out forest fires, said fire patrol to be organized and controlled by the University of California through its School of Forestry. Your committee will naturally invoke the aid of the Water & Forest Association, the Sierra Club and the superintendents of the United States Forest Reservations in the State, both in the preparation of the bill and in its passage through the Legislature, and there is no doubt of their hearty co-operation.

"It is particularly appropriate for the Miners' Association to present and carry forward a method for the preservation of our forests. We have the reputation not only of destroying them, but of tearing down the hills on which they grow. If now we come forward and keep them growing, we become protectors of the forests, and we also stop the surface wash and the sudden floods, which, far more than the hydraulic mining, have made our valley friends think we were sending the mountains down upon them."

Treasurer S. J. Hendy reported balance on hand a year ago \$2983.24; total receipts from secretary during the past year, \$1587.20; total, \$4570.94; disbursed on warrants this year, \$3330.33, leaving a balance on hand of \$1240.61.

After the morning session there was an adjournment to the University of California grounds at Berkeley, Cal., to attend the laying of the corner-stone of the new mining building. (An account of this will appear in next week's issue.)

Upon reassembling on the 19th, the third and last day of the convention, the committee on dams and ditches reported, in which a recommendation was made that Congress and the California Legislature be requested to provide for the barriers suggested, and that future operations cover simultaneously all the rivers and tributaries requiring protection of the nature proposed for the Yuba river. The report says:

"It will be noted at a glance that we have entered upon a new era in the effort to solve the hydraulic mining question. We now face actual results. We look into the future without any misgivings. We are filled with boundless hope, based on reasonable and defensible grounds, seeking only that which is right to the mining interests and desiring to do right to all other industries.

"This era not only ushers into existence the barriers on the Yuba, but opens the way, let us hope, in the near future, to the construction of like barriers on streams throughout the mining field.

"The crowning glory of the struggle in which we have been engaged is that, while we have sought to help ourselves, we have not desired to injure others. Indeed, the foundation of the result of our work is based on river improvements for drainage as well as for navigation purposes. Complete protection—aye, better protection than has heretofore been afforded—to adjacent lands must necessarily accompany such improvement. In the system contemplated one cannot exist without the other.

"In view of this fact, and considering that the Bear, American and other streams draining the hydraulic mining areas to the south of the Yuba for the purpose of protection to navigable waters and adjacent lands require the same treatment as that now proposed for the last-named river, it is, as we stated in a former report, 'a source of great regret that litigation has ensued concerning hydraulic mining operations in this State on the suggestion of the Anti-Debris Association, at a time when proposed plans promise so much, both for the farmer and the miner. The Act of 1893, regulating hydraulic mining in California, was conceived in a spirit of harmony. By its river provisions, which are identical with those of the Mississippi river law, the river interests of the Sacramento and San Joaquin valleys and the adjacent lands are afforded ample and permanent relief.

"The completion of the Yuba river barrier will, so far as the river is concerned, give effect to the law of 1893 in its entirety, and for the first time will put in operation its river and its mining features in meeting and overcoming, we confidently believe, the difficulties of the farmer and of the miner. The labors of this organization at this stage are just commencing to bear fruit, and must be kept up with vigor."

H. Z. Osborne read a paper on "Gold Quartz Mining," in the course of which he said:

"Having found the vein and determined that it

contains values sufficient to justify further development, the question frequently arises as to how the work shall be done—whether by shaft or tunnel. The ground may be so flat that a tunnel is impossible, and of course there is then no room for choice. But in California most gold prospects are found in hills and mountains, and a great amount of tunneling is done. The tunnel obviates the expense of hoisting and it drains itself. If it can be run on the vein, and too long a drift is not required to reach the ore shoot, it is often the most satisfactory and least expensive way of opening the prospect. But frequently a considerable crosscut must be run before the tunnel intersects the vein, and then a drift, to reach the presumed ore body. These crosscut tunnels are the rock upon which many a poor prospector, and indeed many a large corporation, has split.

"It is a most natural thing for a man to picture his vein in his mind as running on practically geometrical lines, and as dipping at a certain angle that is fixed in his mind by its appearance at one or more places. In nature, however, the vein rarely continues far on straight lines, either in strike or dip. On the contrary, it has many deviations from what may be considered the general course and dip. As to the dip, it sometimes turns over and completely reverses it. So in running crosscut tunnels, when one has figured out mathematically the point where he should intersect his vein, he may not find it there, because a change in either its strike or dip may have occurred between that point and the last point where he had an opportunity of observing it.

"Again, his crosscut tunnel may be headed for a point directly beneath where the ore shoot showed at the surface. This, however, does not insure his striking ore when he reaches the vein, even though the ore shoot extends to a far greater depth than the tunnel level. The ore shoot has its course, or strike, in the vein, and while that strike downward is sometimes vertical it is rarely so. Generally, if the vein is a northerly and southerly vein, the strike of the ore shoot is either one direction or the other, and some development is required to decide what that strike is. So the crosscut, even where apparently headed straight for the ore shoot, may enter the vein where it is barren. This may be corrected by drifting; but it is discouraging, and one may be at a loss to know which way to drift, and finally take the wrong direction.

"The shaft or incline is more expensive—that is, more expensive per running foot—but is generally the most satisfactory way of opening a prospect."

Professor S. B. Christy followed with a paper on "The Cyaniding of Concentrates." G. J. Henry read a paper on "The Design of Water Wheels for Use in Mining." M. Lindley read a paper on the "Copper Production of Shasta County."

The committee on resolutions again indorsed "the new national demand for a Cabinet Department of Mines and Mining," asked the Legislature to "place the Mining Bureau upon a proper basis by making a sufficient and permanent appropriation for its support," and recommended that the law under which the Mining Bureau exists "be so amended that the management and direction of the bureau and the field work he under the control of the board of trustees;" indorsed the administration of the State Mining Bureau, commended State Mineralogist Ahury, discussed the development of water resources and the preservation of forests, and called for immediate and thorough investigation of water resources, the best method of improving and developing the same, the investigation to be with the collaboration of the National and State Governments, the Legislature to make a proper appropriation for the same. The creation of forest reserves in certain sections was opposed.

On this point it was resolved: "That it is the policy of this Association to encourage the establishment of forest reserves in localities where the same may be established without great detriment resulting to the State therefrom, and where the results therefrom would be beneficial to the State; and though we adhere to that policy, yet it is the sense of this convention that the conditions are not such as to justify the setting aside of the territory proposed and believe that the establishment of such wholesale reserves would result in great injury without any compensating benefit; be it further resolved that this Association recommends a reclassification of such lands embraced in the territory withdrawn, where mining development is in progress, into mining, timber and agricultural land, to the end that the mining lands of the public domain may remain open to location as mineral land."

The usual resolutions were adopted favoring the mineral lands bill; the amendment of the Revised Statutes of the United States concerning the location of mining claims; and requesting the Secretary of the Interior to issue instructions to the local land offices that all lands embraced in dry lakes shall be noted as saline in character and that the burden of proof shall be thrown upon applicants to enter the same to show their agricultural and non-saline character. Resolutions were also adopted asking for an appropriation by Congress for building additional restraining dams and barriers upon the tributaries of the Sacramento and San Joaquin rivers and their branches to the end that hydraulic mining may be resumed in all parts of the State adapted therefor. Further reso-

lutions requested the Secretary of the Interior to provide for geological folios for quadrangles in the northern counties of California and also hydrographic data; instructed the Association's committee on legislation to formulate and urge upon the State Legislature a bill for an appropriation to provide for a fire patrol for the protection of the forests of the State, the patrol to be under the direction and control of the University of California; and also asked the State Legislature to provide a liberal appropriation for a comprehensive exhibit at the Louisiana Purchase Exposition.

The report was adopted unanimously by the convention without discussion or amendment.

Chas. M. Belshaw of Contra Costa Co. was unanimously elected president for the ensuing year; the other former officers were re-elected, and the convention adjourned sine die.

Steam Plant for Gold Mines.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

While the prospectus of a gold mine is usually sanguine of large and permanent results, the promoters are usually shy of ready money for an economical mill equipment, and assume that they can go in and succeed on the strength of the value of their ore, which is counted upon to cover heavy operating expenses and bring them in a surplus which will pay for a larger and better outfit, after which will follow a hauling in of rich revenues. Hopes are so high that the big end of difficulty is cheerfully put first. In other words, a start is made with had management, and the richness of the mine is expected to overcome this handicap. In most cases this is too much to expect of the mine, therefore the mining enterprise fails.

But what help is there for it? The costs of transportation are enormous in a rough, new mining district. At Roosevelt, for example, in the Thunder Mountain country, Idaho, everything that goes in costs 20 cents a pound additional. It has cost \$1200 to get a \$400 piece of machinery to some Central American mines; and in West Africa the jungle is described as so thick that it has to be tunneled, and all machinery must be sectionalized for carriage by one or two men, sixty pounds being a one-man load and ninety pounds a two-man load, the machinery delivered at the mine costing as high as 40 cents a pound. On the other hand, coast mines get their supplies cheap, and machinery is delivered for the Alaskan coast mines at Juneau and Douglas at prices which cannot be approached by most of our Rocky mountain mines.

It is to the interest of all that good policy should be followed. Because an installation of power plant costs so much, it is the more imperative to be sure of the mine; then put in a good plant. To put in a poor, cheap plant because you are not sure of the mine is to make an uncertain, miserable beginning which can only come out right with a very rich mine, while it increases the difficulties of developing an average mine so much as to make discouragement and abandonment of the project almost certain.

I would be willing to sell a cheap outfit of machinery to a company that insisted upon it, but I would not take stock in such a company because I would consider it as evidence that they had not learned their mine, and were "chancing" it in a very hazardous way.

The first thing is to have, and know you have a mine. The second thing is to provide a large power. In the dry mining sections of Arizona it is a trite remark that a water supply is more important than a gold mine, for the water is necessary to power, and without power a gold miner is poor indeed.

"You love life," said Franklin, "then value time, for that is the stuff that life is made of." In a like spirit we might say: "You seek gold, then value power, for that is the stuff that makes gold getting possible."

But power is recklessly wasted about mines. This applies to all of the small mines and a great many which might be described as large enough to know better. Now here is a bit of rational philosophy which might apply even in the case of a small mine in which, from the necessity of the case, power cannot be as economically generated and applied as where it is employed in larger units. Even for a small mine it is good philosophy not to have any avoidable waste of power. If I have a 10 H. P. engine and holler close to their work, with protection against waste of friction by lubrication, and against waste of radiation by covering, and against waste of the lower range of heat by feed heaters and economizers, it is more economical than to put in a 20 H. P. boiler and engine and waste more than half the power. A little overloaded engine, with the covering and auxiliary protection against loss of power as described, will not generally be at so great a disadvantage as a large underloaded engine, with its power leaking away in wet steam and cylinder condensation and in radiation from the accompanying large boiler.

Of course, the covering and the heaters, economizers, good bearings and devices for lubrication cost money, but they do not cost as much as not to have them. This reminds one of the boy's definition of salt as a substance which made things taste bad when it was not in them. The heat savers are the

things that make a steam plant costly when it has not got them, for in them we have a certain cost of apparatus, while the same additional cost put into a larger plant and half wasted means not only the same extra first cost, but also the fuel and operation of the equivalent of a 10 H. P. engine as pure uselessness and extravagance.

Bankers get rich from small increments of interest, note shaving and charges on exchange and collections, but they are like a leak in the bottom of a cistern to the man who has to pay them. Now which is better—to have a tight cistern or to let it leak, and put in a pump of double power to make up for what runs to waste? The answer to this problem is all the difference between thrift and shiftlessness. The wastes are as the architect said of the window—"a hole to heat."

We buy the machinery once for all, or for a term of years with some small tax for repairs, but we buy fuel continuously; we pay a good salary to the coal or wood pile, and it behooves us to see that half of its work is not wasted.

Occasionally when I strike an idea, not a new one (most good ideas are renewed ideas—ideas that have seen the light before, and have been turned down and left for some one else to get the dust off from them and drag them out at a later date)—occasionally, I say, when I strike a good idea and show it up for approval ready to be acted upon, I am disposed to stop short and ask myself, "What is the use?" We have been preaching for centuries since the year one, and the sinners still seem to be the liveliest people in the community.

So the men who make things go, who have the nerve to risk and the diligence and energy to push a new undertaking such as the development of a mine, almost always go about their work raggedly and succeed in spite of their lack of grace, where they succeed at all. And these economic sinners have something to say for themselves. It is a had sign, they say, for a man to be too elegant in going about a mining enterprise, because it is noticeable that when a concern goes in to do prospect work with the best of everything to be had, it almost always spends a lot of money and quits without getting it back.

Then, again, what can we do to comply with fine spun theories of economic efficiency? There is the machinery market. Go and buy for yourself. It is hard enough to get a plain outfit without delay; and if you require frills, the expense is out of proportion to their value when you have not got the price, and the delay is out of the question when you have not got the time.

So much for the miner's end. The manufacturer does not connect with him properly. Pipe covering and oil filters and damper regulators, feed heaters and economizers are all to be had; but if I were to design an ideal small steam plant, I would say here is a 30 H. P. plant. It will cost you 60% more than the ordinary plant that you buy, but it will save more than half your fuel. I have everything made up in stock ready for shipment, have spent a good deal of money getting ready to give you a benefit—will you take it?

The equipment so provided would have a very slow sale, and would not be very profitable to handle. Its commendation would be received with more or less distrust, and why not? Is not the hard, matter-of-fact machinery world full of fairy tales of higher efficiencies and percentages of saving which are not always realized under common conditions of use. We all know what beautiful fruit is grown in the catalogues of the seedsmen; but when we buy their seed, our soil is not always suited for the production of the same results. The pictures are like the prices—subject to discount.

But counterfeits prove the existence of the genuine, and many prophecies only wait for a little more wisdom on the part of all concerned in order to be brought true. To a young man (a willing sacrifice of energy to ambition) it is encouraging to know that the world is not finished. There is a wide margin yet for applied intelligence.

Undeveloped Iron Deposits.

Much thought and many figures result from the fact that the iron deposits of the Middle States are being carefully prospected to determine just how long the ore bodies will supply the demand. Organized capital is at work to secure control of iron ore deposits. A large tract of iron lands in northern Michigan has been secured by the Clarion Steel Co., a rival of the United States Steel Co., the value of the property being stated to be \$60,000,000. This purchase, however, will save the owners for only a few years comparatively from the necessity of succumbing to the United States Steel Corporation, which controls the steel trade of the country; nevertheless the Clarion Co. understands the elements of resistance.

Little iron is now manufactured west of the Rocky mountains, but California has magnetic and hematite ores, from which could be produced the same quality of iron as is made in Russia or Pennsylvania. The consumption of pig iron west of the Rocky mountains is now estimated to be about 512,966 long tons for last year. In addition, the increased amount of heavy mining machinery employed in the new mining districts largely augments this estimate. Such con-

As before turns bottom up over a car running alongside the shaft, the top of the car flush with the bottom of the door. In unwatering the shaft, and hoisting from a sump while drifting, a water harrel with a bottom valve is used, the 2x4 taken off, the filled harrel let down onto the door, the water running off the door to the drift. The bottom of this drift, near the shaft, was all carefully filled in with concrete, so that there is no leakage back into the shaft. All

parts of the door, slides, etc., where wear comes are covered with strap iron, the sliding surfaces kept greased.

This arrangement has been in use the past three

holder of the claim is to be given the benefit of the doubt. On this very point raised by our enquirer the then Commissioner of the General Land Office, Williamson, says:

a, Crank to engineer; b, Pulleys; c, Cross layer of bottom; d, Sides; e, Upper layer of bottom; f, Gate from ore chute; g, Tripping piece; h, Bolts; i, Ropes to weight box; j, Weight box; k, End block.

seasons. It has given entire satisfaction and enables the engineer to handle water very rapidly and easily. I enclose you some sketches of this device drawn to scale 1 inch to a foot. E. L. BALLOU.
Pony, Mont., Nov. 9, 1902.

Expenditure on Unpatented Claims.

Kindly answer through "Concentrates" or otherwise the following: This company has bought seven separate, but contiguous, placer mining claims, to work which we are building a dredger, and, of course, are spending many times the amount required by law for annual assessment work. Will the money thus expended on this dredger and other improvements, intended for the benefit and to enable us to work all of these seven claims, apply as annual assessment work on the said claims? When the dredger is completed and working, will the money expended for operating expenses during the season, if sufficient in amount, cover the requirement of the law as regards annual assessment work? Or do we have to get out and do \$100 worth of work on each of the seven claims?

If the matter is of considerable importance, as would appear to be indicated by the building of a dredger, it is probable that the safer plan would be to consult a competent lawyer, and he guided by his advice. It is likely, however, that if dredging will be done the accompanying incidental work will aggregate considerably more than the amount of "annual assessment work" necessary to legally hold the claims. As a general proposition, however, the question is an interesting one.

From the County Court up to the Supreme Court of the United States it has been shown, over and over again by decisions, that the intent and desire of the statutes are to require every one asserting an exclusive right to a mining claim to expend something of labor or value on it as evidence of good faith, and on this broad ground, if our inquirer could show that his company's \$40,000 dredger was designed to work those placer claims, that would probably be sufficient, unless there were a contest, when he might have some difficulty in answering a contrary allegation that the dredger could be used elsewhere and was not solely applicable to the development of those particular claims. That is, while the required labor can be applied in any way or manner, it must be in such a way or manner that will show it is unquestionably devoted to and intended for that particular property. Just whether a dredger that can be floated 40 miles away in a day can be shown to be built especially for "that particular property" might be an awkward question if the question was raised, and if the question wasn't raised it wouldn't make any difference if there wasn't a dollar spent on the seven claims in work or improvements.

The general ruling of all the courts and public officials is, however, lenient, the idea being that where there is no manifest attempt to evade the law the statute is to have a liberal construction and the

"All improvements made upon a mining claim having a direct relation to the development thereof may be taken into consideration. * * * Any building, machinery, roadway, or other improvements used in connection with and essential to the practical development of the claim."

This would embrace the question submitted. "Lindley on Mines," discussing this subject, also says: "Labor and improvements within the meaning of the statute are deemed to be done on a mining claim * * * when the labor performed or improvements made for the purpose of working, prospecting and developing the ground embraced in the location, or for the purpose of facilitating the extraction of the mineral it may contain."

These last citations would seem to warrant the belief that the work on "the permanent improvements intended for the benefit" could be considered as sufficiently complying with the requirements.

Imperial Cyanide Method.

At the Highland Chief mill, Spruce gulch, Deadwood, S. D., operated by the Black Hills & Denver G. M. Co., is the Randall system of slimes treatment. The apparatus consists of a series of cone-shaped settlers with a specially formed bottom and a special method of introducing the material near the center and directly over the central bottom discharge opening, whereby rapid subsidence of the solids is effected while the separated and clear solution carrying the values flows continuously over the top of the settler and is caught in a suitable launder.

Twelve tons per day fine, clayey slimes, twenty-eight tons sand, making fifty tons ore, and 200 tons of cyanide solution go through the battery; but only forty tons of this solution is in stock, as it is used over and over again. The sand is taken out in a hydraulic separator when the remainder of the material is ready for the special treatment. This consists in decanting off the battery solution from the first settler and returning it to the stamps. The thickened slimes, consisting of 40% to 50% dry solids, is drawn from the bottom of the cone in a continuous stream and forced to an agitator and washer placed over and discharging into the second settler. In this washer it meets several times its own weight of wash decanting from the third settler. After this first wash it flows into the second settler, subsides to the bottom and is forced to the second washer, while the wash carrying the values goes to the battery circuit to be further enriched before going to the zinc extractors. The slimes receive as many washes as desired by providing the proper number of settlers; the operation is continuous and automatic. The saving of values is stated to be as follows: Moisture (battery solution) in slimes leaving first settler, \$5.20 per ton; moisture in slimes leaving second settler, \$1; leaving third settler (after two washes), 12 cents per ton. The wash is composed of sump solution continuously taken from below the zinc boxes.

A Modern Gold Mill.

On page 298 is a description of the first stamp mill in operation in the United States, nearly seventy years ago, the prototype of hundreds of great gold mills throughout the West, of which the new Portland mill at Colorado City, Colo., is a good example.

The Portland mine, in Cripple Creek district, last year produced 77,000 tons ore and this year will produce about 100,000 tons. Upon the treatment of that ore depends all the difference between profit and loss. The possession of a suitable mill, properly located, gives opportunity for the exercise of the little economies and savings that make or mar any business. The custom mills allowed the Portland Co. \$20 per ounce for the gold; the Portland mill sells the product—\$20.67 per ounce—direct, the 67 cents amounting to just \$55,000 on the 77,000 tons ore handled last year; that \$55,000 is 6% interest on \$916,000. The cost of the mill was \$500,000. The mill is treating its own ore for \$4 per ton, saving \$3 a ton—a yearly saving on the 1901 basis of \$231,000.

Unlike many other similar "plants," the Portland mill is fireproof. Brick, iron and steel make up the walls; the floors are asphalt and concrete. The latter serves another economic purpose, as the dust which carries so much gold is easier collected.

The process of handling gold in a chlorination mill is familiar to all readers of this paper; the ore unloaded direct from the railroad track into bins with a storage capacity of 500 tons each, thence by gravity through a chute down to the grizzlies, the coarse rock passing on to great crushers that crack it, the mass being automatically lifted one floor and run through rollers that reduce the largest pieces to uniform size; thence (still automatically) through long iron barrels revolving horizontally, over a heat of 400° F., to drive off the moisture; thence to the screens, and then through a final set of crushers that make of it a flour-like powder; up by elevators to near the roof, there automatically sampled; then through another chute to the roasters—three circular furnaces, each 10 feet high, 60 feet diameter—through which rake the ralhles, keeping the roasting mass in constant motion for four hours in a heat from 900° to 1700° F.; then to the cooling hearth, where cold air quickly lowers the temperature of the incandescent dust, that, now no longer glowing, is again hoisted, weighed and dropped into twelve chlorination barrels, each holding 5000 gallons water, charged with chlorine gas under pressure, these barrels or tanks revolving for three hours, when the chloride of gold is changed by sulphuretted hydrogen to sulphide of gold, precipitated, passed through presses, melted, parted and made ready for the mint.

The G. E. Hose Couplings.

In the accompanying engravings is illustrated a new hose coupling which the manufacturers say embodies a number of improvements that will appeal to

all users of hose. The method of attaching the hose to the coupling by means of clamps has long been unsatisfactory to engineers, but this point seems to have been satisfactorily solved in the G. E. hose coupling, which holds the hose securely compressed in a metal pocket without the use of outside clamps. The G. E. hose coupling is the invention of E. A. Rix of San Francisco, and is being manufactured under his patents by the American Engineering Works, 204 Dearborn St., Chicago, Ill.

The G. E. couplings are suited for working under very heavy pressures. In the G. E. coupling the end of the hose is in a metal pocket and leakage is impossible. A noticeable feature is the increased size of the air passage, which is larger than is possible in old style couplings, where the hose is drawn over the corrugated end of the coupling.

The illustrations show the G. E. coupling in general view and in section. The coupling consists of four parts and is entirely self-contained, not requir-

ing the additional purchase of hose clamps nor involving the expense of their renewal.

The substantial proportions of the G. E. coupling and the absence of projecting bolts guarantees long life. The hose is firmly secured by the pressure of the tapered portion of Part 3, which is secured into Part 4 by means of the square socket at the larger end. There are several slight depressions in the walls of Part 4, into which the pliable hose imbeds itself, making it impossible to withdraw the hose until uncoupled. A rubber gasket is used between the faces of Parts 1 and 3, and in making connections with this coupling, Part 1 having a female end, may be attached directly to the pipe line without the expense of a pipe coupling.

A Butte Miner's Opinion.

W. F. Word, superintendent Gagnon mine, has returned to Butte, Mont., from New York. "I was particularly interested," said he, "in the excavation work that is going on for the great underground railroad, and, as a mining man, was not much impressed with their style of doing such work in the big metropolis. I believe that the contractors and superintendents of that big job could come to Butte and learn something of almost any practical mining man. It seems to me that they go about it in the most impractical and expensive way. I noticed particularly on one contract that instead of cutting down and getting a face on the work and then drilling horizontal holes for blasing, they were drilling vertical holes in the top of the rock. This scales off the rock, the blast being anything but effective, whereas a blast put in horizontally would throw down twice or three times the amount. Then there are so many men massed together that they are in each others' way. I believe the contractors are to receive something like \$35,000,000 for this work, and if they make a reasonable profit at this figure they might increase it if they did their mining according to the Butte method."

Improved Cathode Plate.

W. A. McCoy of Perth Amboy, N. J., has invented an improved cathode plate, illustrated herewith.

Fig. 1 is a front elevation of the improved plate. Fig. 2 is a side elevation of the same. Fig. 3 is a top-down view showing a modification of construction; a indicates a cathode plate, of copper or other suitable metal, having means such as the integral hooks b b at the top, by means of which the plate may be suspended to extend into the electrolyte. At or near the lateral edges and bottom of the plate a or other suitable position to facilitate stripping at opposite sides thereof are series of recesses formed in the face of the plate, forming receptacles for an insulating or electrically non-conductive material c c c. These recesses are preferably short drill holes separate and apart from one another, so that the insulating material c c will remain therein with security and not be detached under the rough treatment to which the more or less heavy plates are subjected when the same are handled. The perforations are close together, so that the exposed metal between them will form but slight connections of the deposited sheet with the metal deposited at the outside of the series of perforations; thus the deposited sheets may be easily stripped from the cathode plate, the sheet being easily torn or severed from the edge metal in the act of stripping. The edge deposited pieces may be removed from the cathode plate after stripping and be used as scrap metal or otherwise. The holes are usually drilled $\frac{1}{4}$ inch diameter and $\frac{3}{16}$ of an inch from center to center. The insulating compound may be of any insulating material, such as abietic acid anhydride and bitumen, grease, or other matter capable of withstanding the action of the electrolyte and the conditions under which the same is employed. The recesses at the sides and bottom of the plates may be continuous, as in Fig. 4.

The Mineral Crest, or the Hydrostatic Level Attained by the Ore-Depositing Solutions, in Certain Mining Districts of the Great Salt Lake Basin.*

W. P. JENNEY.

In the limestone area of Tintic and other mining districts of the Great Basin region of Utah it has been observed that surface outcrops of ore occur but seldom, and are mainly confined to points of relatively low elevation, where the veins cross some basin or ravine. Nowhere does a considerable body of ore outcrop on the tops or high up on the slopes of the hills.

Mining operations, on the other hand, have shown that large and continuous ore deposits frequently occur in depth in the limestone, beneath large masses of barren rock. Such ore bodies, when followed upward in the lodes, are found to terminate at well-defined levels, without reaching the surface. Yet the ore-bearing fissures themselves extend above the top of the ore, being often traceable, though barren of all valuable minerals, for hundreds of feet above the stopes in the mines, and even observable in outcrops at the surface.

This abrupt cessation of the ore at a uniform horizon does not appear to be connected with any change in the country rock adjacent to the lodes. The strata above and below this horizon seem to be in every way equally favorable to ore deposition. Explorations above it have developed an open-fissured country, not only of ore, but also of indications that mineral-bearing gold, silver, lead, or copper were ever deposited in the strata at that elevation.

The height reached by the ore, while usually constant throughout the length of a given lode, may vary in particular sections from the operation of local causes. Each lode in a district has its own distinct horizon, above which the ore deposits do not extend. Where the ore bodies are continuous for a long distance on the strike, and other conditions are uniform, the top or apex of the ore is nearly level or gently undulating; but more commonly its upper surface is broken into a series of peaks and pinnacles, alternating with flat summits and wave-like crests, reaching up from the main ore channel to practically the same relative altitude, and forming the ore crest or mineral crest of the lode.

Examination discloses in these mines many evidences that the terminal edge of the ore nearest to the surface represents, substantially, the height to which the mineral-depositing solutions ascended in the fissures during the period of ore formation—in other words, that the present ore crest is the high water mark, or ultimate level, reached as the result of the ascensional force of the heated ore-bearing waters.

In some instances lines of extinct mineral vents, nearly over the ore bodies, on the surface, mark the course of the lode. These are small local outcrops of quartz, chalcedony, siderite, ankerite, barite, and other gangue minerals, seldom carrying more than traces of the precious metals. It is not improbable that, during the period of ore deposition, these vents were geyser-like pipes or channels, extending from the ore deposits, hundreds of feet below, up through the non-mineralized strata to the surface, and constituting points of escape for steam and gases liberated by the chemical reactions incident to the formation of the ore. Surface explorations of some of them indicate that they were channels of up-flow for the waste waters expelled by the pressure of the steam and gases, after the deposition of the ores in the deeper strata. Among other evidence supporting this view is the occurrence in thick, handed sheets, lining crevices and open channels in these outcrops, of white, translucent chalcedony, a mineral deposited by hot silica-bearing waters.

To better understand these peculiar phenomena, it is necessary to consider the conditions attendant upon their formation. The earlier volcanic disturbances of the region are regarded as the direct cause of the elevation of the district and the up-turning of the sedimentary rocks, producing the numerous small mountain ranges and solitary island-like upheavals which illustrate the varied types of the Basin Range structure.

These earlier disturbances were followed by a long period of comparative rest, during which a wet climate prevailed and an extensive erosion of the exposed strata occurred, carving the surface of the district to its present contour. There were the same low mountain ranges, with spurs projecting like promontories into the sands of the desert, their steep slopes deep cut by narrow, rocky ravines, or scooped

out in basin-formed gulches. Later disturbances, deep-seated in the earth's crust, formed the vein fissures and induced the deposition of the ores at a time when the topography of many of these mining districts varied little from the present surface. The recent erosion, which has taken place since the deposition of the ores, has probably not removed, even on the more exposed slopes, more than 100 to 200 or 300 feet in depth of rock surface. This preservation of the ancient topography has been due, in great part, to the change in climate. In the present extremely dry period surface erosion is reduced to a minimum. So little are the outcrops of the ore bodies eroded that the conclusion seems inevitable that the present arid climate has prevailed continuously since their formation.

In such districts the outcrop, or intersection of the vein fissures with the old surface erosion, would be, in profile, an irregularly broken or serrated line, rising from the lowest points, where the fissures crossed some deep ravine or basin, to summits where the fissure helt cut through the tops of the hills or divides. Under these conditions the mineral solutions, forced upward in the fissures, found outlets of escape at places of relatively low elevation along their course, with a consequent reduction of head or hydrostatic pressure so great that, no matter how open the fissures, or how favorable the ground, no considerable deposits of ore could be formed above a certain level, depending upon the elevation of the outlets and the volume of the discharge, through them, of the heated waters, with the accompanying steam and gases.

Not only has the hydraulic head been controlled by outlets to the surface, but the escape of the solutions from the fissures into the walls and into the country rock adjacent, especially in mines in limestone, has also acted to some extent in the same way. The slow circulation of the mineral-depositing solutions through large caves or chambers, or through the interspaces in great masses of brecciated rock, from the extent of surface exposed and the free escape of steam and gases, has caused a reduction of both temperature and initial pressure.

During the long period of ore deposition fluctuations caused by any increase or diminution of pressure or of temperature in the ascending waters would naturally occur in the hydrostatic level. It must have been subjected to various accidents, such as the opening of new outlets at lower levels, or the choking or closing, by any cause, of outlets long in action. Moreover, the up-flow through the fissure would be modified by crustal movements opening or closing its channels, and thus affecting both its volume and its pressure. Many other factors—for instance, the specific gravity of the solutions and the proportion of steam and gases mixed with them—must have had their effect.

The mixture of a liquid with gas reduces the weight of a given column, and when this column is under a hydraulic head not thus affected this reduction of weight is equivalent to an increase of pressure in augmenting its flow. Friction produces a loss of effective head, which rapidly increases in contracted or tortuous channels, and must become very great where the solutions spread out and traverse the interspaces of fractured or brecciated rocks.

Since the completion of the primary ore deposition oxidation and re-formation of the minerals have tended to move the ore crest downward in the fissures, but the quartz and other gangue minerals remain, together with oxidized ores in such quantity that there is usually little difficulty in determining the original crest level.

In most mining regions erosion has been so great since the period of mineral deposition closed that many hundreds and often thousands of feet of strata have been removed, destroying all record of what occurred in the upper part of the veins. So far as observed by the writer, mineral crests such as have been described above occur only in those districts in the Basin region where, at the time the ores were deposited, the surface was deeply cut by erosion, and the later climatic conditions have been such as to preserve the old surface with little alteration—a combination of conditions which might be regarded as exceptional.

Now that attention has been drawn to this subject, it is not improbable that like occurrences will be found in other mining regions of the world, and we may certainly look for the discoveries of similar deep-seated ore crests not formed and determined chiefly, or at all, by the position of surface outlets, but due to the inadequacy of the initial pressure of the heated waters to force them to the surface—a condition comparable to that of many artesian basins, where flowing wells do not exist, because the hydrostatic level is underground.

The observations of the writer indicate that ore crests are not confined to veins or lodes of replacement in limestone, but may occur in fissure veins in quartzite, and in lodes traversing eruptive granitic rocks.

On typical free milling gold ores of grade from \$4 to \$7 the saving on the plates and in concentrates will be from 80% to 94%. The percentage of saving is checked by assay of the final tailings. The mine run assay is not based on as uniform sampling as the tailing assay and cannot as safely be used to estimate percentages from.

Mining and Metallurgical Patents.

Patents Issued November 11, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF MAKING WHITE LEAD.—No. 713,155; W. H. Rowley, St. Louis, Mo.

In manufacture of white lead, conversion of general mass of metallic lead and suboxide of lead to uniform protoxide of lead, by constant agitation while in paste condition and in contact with free air; building up gradually general mass to protoxide of lead, as protoxide is formed (as a pellicle on particles of lead) removing it by attrition caused through agitation, thus continually presenting new surfaces for oxidation; working lead mass in heavy paste form bringing particles of lead in close contact with one another during agitation, to keep mass in general condition of metallic lead and protoxide of lead void of higher oxides, as suboxide of lead formed is rapidly converted into protoxide of lead, allowing particles of lead in mass an opportunity to form high oxides; working lead mass by agitation in this condition until gradually fixed protoxide of lead is formed; then subjecting mass to more severe treatment of oxidation by forcing air into mass in agitation in drum supplied with door at top, open under milder treatment of free air, but closed when air is forced into same; finally washing out and carbonating protoxide of lead.

ORE CAR.—No. 713,321; W. C. Matteson, Stockton, Cal.

Combination in ore car, of truck frame, car body pivotally supported thereon, door having hinges at top pivoted to rear of car body, rolling catches adapted to engage lower portion of door, door hinges consisting of metal straps extending from top to bottom of door, each having backwardly projecting hinge lug or extension embracing pivot on car body, lower ends of straps serving as chafing plates for catches.

EXHAUST PIPE MUFFLER FOR GAS OR OTHER ENGINES.—No. 713,536; J. L. and C. J. Tobias, Chicago, Ill.

In muffler for gas and other engines combination of shell provided with series of small apertures grouped on one side cylindrical wall thereof extending from one end toward other end, bushing on one end wall of shell, provided with shoulder abutting against end wall, pipe secured in hushing, extending through

other end of shell, cap closing pipe, pipe and cap provided with corresponding screwthreads to force end of cap against end of shell adjacent thereto, pipe provided with series of small apertures grouped on one side thereof extending from near one end thereof.

GOLD SEPARATOR.—No. 713,105; F. M. Johnson, San Francisco, Cal.

Combination of casing, plurality of arms pivoted to each side thereof, arms of each side pivoted alternately at opposite ends, vertical adjusting bar arranged centrally on each side connected to all arms on its respective side, and midway of length of arms; removable trays inserted through openings in casing supported on arms, each tray having gold-retaining bottom surface, and cross bar near its initial end with flexible apron connected to cross bar.

DUMPING DEVICE.—No. 713,220; C. W. Howbert, Cripple Creek, Colo.

Dumping device, bucket, swiveled ring connected to bottom of same, sliding door carrying hook adapted when operated to automatically engage swiveled ring, close shaft, and direct dumped material from shaft.

MINE TRAP DOOR.—No. 713,181; J. Wack, Canton, Ohio.

Combination of self-closing mine trapdoor; of actuating bar arranged adjacent to one rail of track operatively connected to door for opening same,

catch, latch carried by door adapted to engage catch and hold door in open position, second actuating bar arranged in close relation to track rail, releasing means operatively connected to last named actuating bar for releasing latch from engagement after car has passed through door opening, latch and catch holding door open against tension of self-closing means, whereby when latch is released, door is allowed to close automatically.

JIG FOR ORE WASHING.—No. 713 436; C J Hodge, Houghton, Mich.

Jig for mineral or ore washing, comprising in combination tank, one end wall of which is lower than other walls pivoted with outwardly projecting lip, screen frame supported in tank, means for vibrating screen frame, one end wall of which screen frame is in plane below other walls, but in plane above lower end wall of tank, provided with overflow lip projecting from tank lip in plane differing therefrom in pitch, whereby clearance is provided for oscillation of screen frame end walls, screen and screen supporting frame, contents of screen frame prevented from overflowing sides.

METHOD OF CONSTRUCTING TUNNELS.—No 713 520; C. SooySmith, New York.

Method of constructing tunnel consists in placing plurality of piles in line of proposed structure, at such depth that their heads shall be on substantially same level as bottom of proposed structure; advancing shield through surrounding material in close proximity to and over piles; constructing tunnel upon piles.

A Georgia Stamp Mill.

Of some historical interest is an account of "Gold Mining in McDuffie County, Georgia," by W. H. Fluker of Tatham, Ga., at the recent meeting of the American Institute of Mining Engineers.

McDuffie county is crossed by the Georgia gold belt, which is about 2 miles wide and contains quartz veins carrying gold ore shoots which were first prospected in 1826.

"In 1833," says the writer, "J. Griffin purchased the rights of his associates, who had up to this time confined their work to placer mining on a small scale. He erected a stamp mill, the old mortars of which can now be seen near the point on Little river where the mill was first used in 1833. They were rectangular in shape, 10 inches wide by 14 inches deep and 30 inches long. The stamps, of which there were three, consisted each of a square cast-iron shoe with a square, tapering neck about 8 inches long. The neck was driven into a hole mortised into the end of a wooden stem 6 inches square and 7 feet long, around which was placed a heavy iron band to prevent splitting. The cam shaft was a solid piece of wood 26 inches in diameter with blocks which served as cams mortised into it. These, in revolving, came in contact with other blocks serving as tappets, which were fastened to the wooden stem by means of iron bands and wooden pegs or dowel pins. The mill was driven by an undershot water wheel, the shaft of which was a continuation of the cam shaft. The mortars described above were soon replaced by wooden mortars provided with a discharge and screen, similar to those used at the present time, and having a single cast-iron die extending the length of the mortar. With such a mill, which was probably the first stamp mill erected in America, Jeremiah Griffin, in the year 1837, cleared \$80,000. The ore that was milled was nearly all taken from what is now called the Columbia vein on 'the forty-acre lot,' a vein that is still profitably worked."

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

The cleanup of the Alaska-Juneau mine for the last season was satisfactory. Foreman Barrett is facing the Juneau tunnel to connect the channel with the Alaska-Juneau property. Accommodations will be constructed for the men near the mouth of the tunnel.

ARIZONA.

COCHISE COUNTY.

The Calumet & Arizona smelter, at Douglas, is in operation.

Near Bisbee the two-compartment shaft on the Copper Glance M. Co.'s property is down 452 feet. It will be sunk to a depth of 1000 feet. The company is also sinking a shaft—No. 4—on the south side of the claims. This has reached a depth of 110 feet.

GILA COUNTY.

Furnace No. 2 at the Old Dominion smelter was blown in last week; two furnaces are now in operation. It is locally estimated that the monthly output will be 1,500,000 pounds. Men are being put on every day, and it is expected there will be 600 on the payroll.

GRAHAM COUNTY.

C. P. Rosecrans, manager Standard Copper mines, tells the Era that from January 1, 1902, up to and including October 24, 875.39 tons of copper ore had been shipped, for which net returns had been received amounting to \$18,397.34. The ore made a general average of 24.39%. The company will build ore bins on the line of the Coronado railroad, about three-quarters of a mile from the mines, to which the ore is carried by burros. The company will erect an incline tramway from the mines to the ore bins.

MARICOPA COUNTY.

Near Wickenburg, the Electra M. & M. Co. has an ore body 3 feet wide at the 210-foot station. An electric hoist is contemplated.

The Phoenix & Eastern road, from Phoenix to Benson, within sixty days will be in operation from Tempe to Mayer, 14 miles. The total length of the projected road is 185 miles; it penetrates a low grade ore district.

MOHAVE COUNTY.

The Chloride smelter has started up.

PIMA COUNTY.

Supt. Brownell of the Producer M. & S. Co. has twenty men at work on the company's property and is putting up large buildings at the camp.

PINAL COUNTY.

The Paraffine Co. has oil near Florence at a depth of 600 feet, the first oil found in that territory.

YAVAPAI COUNTY.

C. W. Platt, superintendent the Illizona M. Co., has begun work on the properties in Kirkland mining district.

Jerome sends word that the United Verde mine will resume this week, after a compulsory shutdown of four months.

CALIFORNIA.

AMADOR COUNTY.

The Del Monte superintendent reports that in September a crosscut tunnel was run 50 feet, at a cost of \$12.18 per foot; in October, 52 feet, \$10.70 per foot; upraise run, 79 feet, \$5.15 per foot; tunnel run, 125 feet, \$1.40 per foot; average width of ledge, 18 inches. Stamps are dropping under the supervision of B. C. O'Neill.

F. R. Culbertson is back from Washington. He says: "We have a long term lease on the Wildman & Mahoney and we are developing it carefully to see what it is worth before deciding on whether we shall take up the bond. We are down 1400 feet, and the ledge there is from 30 to 40 feet wide. There are upwards of 1,000,000 tons in sight. Much of it is of low grade, but it can be mined, hoisted and milled for \$1.75 a ton, so that the average needs not be high to pay. Upwards of \$5,000,000 was taken out of the mine in the old days, with an average of from \$6 to \$8 ore. The property has on it eighty stamps, and we have been working thirty of them. If we decide to take over the mine we shall equip it with a total capacity of 200 stamps, which will handle 1000 tons of ore a day. The ore there can be milled for 25 cents a ton."

The Gwin Mine Development Co. has declared dividend No. 39 of 10 cents per share, making a total for 1902 of \$140,000 and a grand total of \$411,500.

BUTTE COUNTY.

The Golden State Power Co. has incorporated in San Francisco to furnish electric light and power; H. P. Hussey, presi-

dent; H. F. Lange, assistant secretary and treasurer. The company proposes to use the North Fork of the Feather river from Big Bend to Big Meadows. The hydraulic project contemplates a plant of 40,000 H. P.

CALAVERAS COUNTY.

The Black Cat M. Co. is organized, W. T. Robinson superintendent. The property is the northern extension of the Esperanza mine.

Superintendent P. L. Shuman has resumed work on the Lancell gravel mine, near Buckeye.

Kavanaugh & Lewis of the Western Mines Co. are developing the Foote & Thompson mine at Rich gulch.

W. J. Nelson will open extensive gravel ground at Calaveritas. The present ditch will be enlarged to a width of 5 feet on the bottom.

The Utica mill has resumed. Plenty of water is assured for continuous operations.

DEL NORTE COUNTY.

At Gold Beach, where Rogue river empties into the Pacific ocean, a deposit of sand has accumulated, covering hundreds of acres and ranging in depth from 10 to 30 feet. Rogue river passes through a country of gold and copper ledges, and in its flow to the ocean it has been wearing away the gold-laden rock and carrying it in tiny flakes to where it meets the waves of the Pacific ocean, and there deposits the sands and gold. A storm arises on the ocean, the waves beat along the shores and the gray sand is washed away and the deposits of black sand are left. By laborious methods these have been worked, and the returns to the man have varied from \$3 to \$100 per day. When one spot has been uncovered by the ocean and the gold taken out, another storm will uncover as rich a spot somewhere else, and another find is made. No one has a monopoly of these deposits of black sand, for they are found along the beach for miles, and all the miner does is to watch for the action of the waves to take away the gray and expose the heavy black sands, carrying gold.

EL DORADO COUNTY.

Some time ago the Montauk M. Co., former owners of the Zentgraf mine, in insolvency, transferred the mine to W. D. Goodwin, one of the stockholders, to satisfy a debt of \$55,000. Other creditors are now seeking to have this transfer set aside, and the case is on trial.

The Levitt Con. M. Co. has been incorporated in Los Angeles to develop the Levitt group of quartz mines near Kelsey.

INYO COUNTY.

W. G. Nebeker, who has returned to Salt Lake, Utah, tells the Tribune that the owners of an Inyo county group, for which the Hearst estate was paid \$25,000 a short time ago, have rejected a bid of \$350,000 for it.

KERN COUNTY.

The Standard Co. has begun building three earth reservoirs for oil storage, capacity 75,000 barrels each. The Standard's storage facilities in that district are estimated to be 128,562,500 gallons.

At Bakersfield the Pacific Smelting Co. has incorporated "to own and operate mines, smelters, railroads and other properties." A. W. Macrae, B. L. Brundage, A. Well, H. P. Bender, G. W. Lupton, J. W. Scott, C. L. Cladn, G. T. Nighbert, C. Bickerdike, C. W. Wickersham, all of Bakersfield. They say they will have a smelter of 100 tons daily capacity. Oil is to be used as fuel.

MONO COUNTY.

The Sweetwater M. Co. will run a 200-foot drift and put in a concentrator and slimes plant next spring.

NEVADA COUNTY.

The W. Y. O. D. mine is being unwatered.

The hoisting works at the Conlin mine are completed; a large mill may be erected on the property to take the place of the one recently destroyed by fire.

The California Electric Co. will enter Grass Valley with power from Alta, where it has works.

PLACER COUNTY.

A drain tunnel is being run at the Boulder. After the mine is unwatered a five-drill compressor will be put in. The Eureka is producing. A sale to the Hathaway Co. is reported likely. The Eclipse is now down to the 500-foot level. Peters & McLaughlin have the Lizard property at Bald Hill and will work it this winter. Manager Manson is unwatering the Calf Pasture mine at Rock creek.

SAN BERNARDINO COUNTY.

At Dale the O. K. has been sold. Men go to work on it next week. The Brooklyn mine has run continually all summer. The cyanide plant is in full operation.

W. A. Clark of the San Pedro, Los Angeles & Salt Lake Railroad says the road will at once be built from Barstow to the north and the south over the desert. Four thousand tons of steel rails have

been laid down at Barstow for about 20 miles of track. This was the original plan. Barstow is where the survey of the San Pedro crosses the Santa Fe. This settles the route through Nevada also, as the San Pedro, by crossing at Barstow, will adopt the old original route in Lincoln county, and after crossing at this point can reach Cajon pass.

SAN DIEGO COUNTY.

The California King G. M. Co., Picacho, has filed five additional placer claims along the Colorado.

SANTA CLARA COUNTY.

Near the New Almaden, 12 miles from San Jose, the Ella Copper M. & D. Co. are reported to have a ledge of 10% copper.

SEASTA COUNTY.

The Huron Submarine Gold Mining & Construction Co. is dredging in the Sacramento river, above Redding.

The Millville Tidings alleges that Clover creek cinnabar mine samples assay 27.5% quicksilver.

SISKIYOU COUNTY.

The Journal says that A. C. Brokaw of the Quartz Valley hydraulic mine has started with his giants and hydraulic elevators, since the late rains. The hydraulic mines at Oro Fino are also starting.

The Blue Ledge mine is reported bonded to W. S. Haskins, formerly of Rossland, B. C., who represents Eastern men. The mine is 2 miles from the Oregon line and 35 miles southeast of Jacksonville. Fourteen claims comprise the group. There is a ledge of copper-bearing ore.

Near Etna, J. W. Harris proposes a mill on his ledge. Work is to be resumed on the Quartz Hill mine at Scott River, with ultimate intention of a mill.

STANISLAUS COUNTY.

The Standard has laid off work on the long pipe line, the present terminus being at Newman, 110 miles from Point Richmond, it is supposed, because of failure of material to arrive. Since its inception, the line has been close up to the shipments. Men are still putting in pumping plants and building the stations.

TRINITY COUNTY.

Coffee creek is again attracting attention. Weatherby and Drennan have claims on Coffee creek, near the Yellow Rose, and are taking out an average of \$8 a day to the man by hand mortar.

The new mill on the Chloride-Bailey group, near Weaver, owned by the Trinity County G. M. Co., is working successfully. It has twenty stamps and the old mill ten stamps. They are getting seventy-five tons a day through the plants. They have a cyanide plant at work on 20,000 tons of tailings at one dump, and are taking ore from a shoot 4 feet wide and 500 feet long, operating 700 feet deep. The ore runs from \$14 to \$15. Of that they catch about \$10 on the plates and get \$2 in the concentrates, while the tailings carry a little more than \$2. They are cyaniding the tailings at a cost of about 75 cents a ton and are saving about 90% of the values. They have seventy-five men at work there.

The Jenny Lind & Maple M. Co. has a promising property near the Chloride-Bailey. The showing is considered good enough to warrant the erection of a 20-stamp mill next season. The Chloride-Bailey is an old mine, which had been formerly operated. The Jenny Lind & Maple is virgin ground.

The Texas Jack mine, Indian creek, is reported sold for \$21,000 to W. & M. Collins. Two miles from the Texas Jack is the Oriole mine, worked and owned by Collins Bros., who, before buying the Indian Jack, bonded their Oriole property to Washington men for \$25,000.

TUOLUMNE COUNTY.

(Special Correspondence).—At the Republican mine the enlargement of the mill is about completed. There is enough water to run the compressor. The Crystalline mine, near Jamestown, is employing thirty men. Manager A. C. Morison is crushing ore and will keep his 10-stamp mill in operation with ore from the 600-foot level. A telephone is in at the Sell mine, which from the 300 level tunnel has been stooped out to the surface. A shaft is being sunk to strike a crossing at the 400 level.

At the Horseshoe Bend mine two crosscuts are being run to tap the two veins intersecting the property. Geo. Morice is in charge. A new plant has been installed at the Sonora chlorination works for roasting ores. A new patented process is to be employed, the main features of which are fine pulverizing, quick roasting on a hearth inaccessible to the flames of the furnace, and a subsequent amalgamation by prepared quicksilver.

Superintendent Parrish of the Spring Gulch mine reports a vein of ore on the hanging wall crosscut on the 300-foot level, and ore in drifting under the old workings at the 200 level.

Sonora, Nov. 17.

The main shaft at the Mazeppa mine is down 830 feet.

Superintendent Trittenbach expects to start work on the Dreismann mine Dec. 1st with twenty-five men. Sinking from the 400 foot level will be started.

The Magnet hears that the Big Casino M. Co. has the Mack mine at Big Oak Flat and will put miners at work.

In the Bell mine, Tuttle town, on the 400 level, drifts are being run on the vein north and south, ore showing across the face of both. A crosscut run shows the width of the ore body to be 30 feet.

At the Ohio mine an air compressor is in. Power drills will be used. The Crystalline mine will start November 24th. Thirty stamps will soon be dropping in the Harvard mill. At the Jumper mine there will be an increase in the force.

S. E. Rigg has charge of the McAlpine mine. A hoist 35 feet high is completed.

YUBA COUNTY.

Superintendent P. H. Thornton of the construction work of barrier No. 1 on the Yuba, near Daguerre Point, says he has eighty men and several teams at work. The rock ledge has been uncovered; work of taking out the rock for use in the barrier is under way.

COLORADO.

ARAPAHOE COUNTY.

At Denver, D. Guggenheim says: "We have now enough smelters. What we want are mines. We are after them, regardless of location, providing they are what we want and reasonable terms can be made."

BOULDER COUNTY.

Near Eldora, the Revenge Dev. Co. have men pushing their tunnel on Bryan mountain. Superintendent Hutchins says the tunnel will be 8x8 feet in the clear, double track and water channel. First 50 feet are to be timbered with 10x10-inch sawed timbers.

CLEAR CREEK COUNTY.

(Special Correspondence).—The Idaho Springs M. & R. Co. is having Bonnie & Lee prepare plans for the overhauling of their old mill. They will put in crushing and concentrating machinery and make the same an up-to-date mill for treating their grade of ore. A 200 H. P. steam plant is being put in. Idaho Springs, Nov. 14.

Near Idaho Springs, Manager Morgan has a new plant of machinery for the Arizona mine. Sinking of the shaft is to be resumed to a depth of 1000 feet.—The Roberts mill is putting in a new flume 2000 feet in length along Clear creek, and will have an additional 100 H. P. as auxiliary to the Chicago creek power, the mill being located at the junction of both streams.

The work of extension of the Colorado & Southern Railroad from Silver Plume to the Terrible mine is completed. The mill is being finished and the flume from the dam is completed.

The Georgetown Courier says the Elkins Co. is advancing construction work at the Terrible mine. When the engine is in place, the mine will be pumped out and active mining begun, together with erection of the new mill.

Idaho Springs says J. G. Roberts has found the lode within 1000 feet of the spot where Jackson made his find which created so much excitement in 1859. The lode was found by accident, it lies at the upper part of the old Jackson placer, on Chicago creek, and courses from northwest to southeast. A hole has been sunk on it for 10 feet, opening into about 6 feet of free-gold quartz. More than forty-three years ago Jackson made the first discovery of placer gold at a point near the mouth of Chicago creek. The gravel produced \$500,000 worth of gold, but the vein from whence it came was not found. Lodes were frequently encountered in that section, yet the one with its free gold remained a mystery. The placer miners found quartz carrying free gold in the placer, an indication that the lode was not far away. Men prospected for miles along Clear creek and in several cases were successful in opening up pay bodies of mineral, notably the Quito, about 1 mile beyond. But the lode which produced the free gold was never found till a few days ago. The vein is free milling and flakes of free gold are found throughout the lode. The foot wall is well defined, almost like slickenside. Through the placer ground it was covered very deep by slide and had never been located, although what was known as the "big vein" had been prospected within 30 feet of it for many years without much success. The vein is 20 feet wide and carries about \$4 in gold to the ton, belonging to the owners of the Central tunnel.

CUSTER COUNTY.

A test run of ore from the Bull-Domingo mine shows a saving of 98%. The properties of the Valley M. Co. are

being advertised for sale by the sheriff. The management of the Bassick mine is shipping concentrates.

FREMONT COUNTY.

Near Florence, the Frazer Oil & Dev. Co. has drilled into a seventy-five barrel oil well at a depth of 1660 feet.

GILPIN COUNTY.

The Specie Payment mine on Bellevue mountain is making shipments to the Hidden Treasure mill at Black Hawk and the returns are said to average close to three ounces gold per cord. The monthly production of the property is usually about 100 tons, the first-class ore going \$100 and better. The company is making shipments also to the Golden smelter of a still lower class of smelting ore. E. W. Williams is manager.

Machinery has been taken from the Lotus shaft and installed on the Peck shaft of that group. Sinking has begun. Sternberger Bros. intend to make this the main working shaft on the east end of their holdings and will sink several hundred feet.

A survey is being made from Yankee Hill for a narrow gauge railroad to be built from Central City to Yankee and Alice; estimated cost \$250,000. J. Wilson, Des Moines, Iowa, is chief engineer. The new railroad will be between 12 and 15 miles in length, which will be decided on as soon as the surveys can be made determining its exact course. Those in charge of the surveying work say that the new road may be built from Central City around by Russell Gulch.

At Central City is incorporated the New Epoch G. M. & L. Co., B. Ross, Z. T. Brown, E. S. Alnutt, T. J. Ballantine, to operate in Gilpin and Teller counties, main office in Denver. They have a lease on the New Century lode, in Eureka district.

By tramway from the mines on Quartz hill operated by the Kansas-Burroughs Consolidated Co., for the month of October was shipped 254 cars, which, with fifty tons from the University-Kansas, made 260 cars, 2210 tons.

The Pearce mine, on Nevada street, will be reopened. E. H. Messiter, manager.

E. S. Moulton, manager the Rocky Mountain mill at Black Hawk, has a lease and bond on the Corydon and Adaline properties.

Near Central City, Supt. Ballantyne of the Ingalls G. M. & L. Co. has a group of claims on Gunnell hill. Bodies of low-grade ore are exposed and values are improving.

A strike is reported in the Saratoga mine; at the depth of 1000 feet a body of ore 28 feet wide.

HINSDALE COUNTY.

Near Lake City the working shaft at the Ute & Ulay mine, Henson creek, now down 140 feet, will be continued until the Ute vein is cut at an estimated depth of 550 feet. Should the ore bodies then warrant it, the company will erect a concentrating plant and the shaft continued a further distance of 650 feet to the 1200-foot mark, where the Ulay vein would be intersected.

The new mills at the Henson Creek Lead Mines Co. and the Red Rover Co. properties are ready to grind.

Superintendent Farrell has the concentrating mill at the Red Rover mine finished and is crushing ore for the Lillie mine. At a distance of 1175 feet the vein is cut, showing a body of ore. Drifting was carried on 500 feet, an upraise made to the upper workings, and at every 125 feet levels run on the vein.

LAKE COUNTY.

Manager McDonald of the Arkansas valley plant, Leadville, says the company will receive at its Denver and Pueblo plants as much low-grade iron as the district can produce and will temporarily waive its treatment charge on all such iron ore carrying up to five ounces in silver, 40% excess basis, with the understanding that when ore received on this basis nets the mine over \$3 any excess over \$3 and up to \$3.50 will be absorbed by the smelting company. The regular schedule on all oxidized iron up to five ounces silver has been 50 cents per ton. The Post shows that if ore carries four ounces silver and 5% excess iron the metal contents will be worth \$2 and the iron 75 cents, or \$2.75. Heretofore this would pay a treatment charge of 50 cents, thus leaving such a narrow margin that the ore could not be mined. The present arrangement permits all such iron being shipped without exaction of any treatment, so that the mines only need figure on mining and hauling. If the value of the ore reached \$3.25 the 25 cents would be absorbed by the smelter, and if \$3.50 then 50 cents would be taken, while if it reached above \$3.50 on ores running not more than five ounces, 50 cents would still be deducted. This rate applies only to low-grade ores. The higher grades of iron are not there-

fore affected, the whole intention of the waiver of the treatment charge on material running up to five ounces silver being to move a tonnage which heretofore it has been unprofitable to mine. The new arrangement takes in every mine in the district.

The New Leadville Home M. Co. will mortgage the property to raise funds to wipe out the indebtedness and carry on future work. It was shown that from March to October of this year the Home Co. has shipped 33,682 tons of ore, from which it received from the smelters \$90,500. The average value of all ore mined was \$2.69, from which, after paying expenses, the company had nothing left and was running in debt. The indebtedness on Oct. 4 amounted to \$7180.

OURAY COUNTY.

At Ouray, the Home pyritic smelter, A. P. Wyman, A. A. Shifter, H. L. Crain, A. J. and W. Desmond, has been reorganized. The plant was consumed by fire eighteen months ago, after which it was rebuilt. The site is at Bachelor switch, on the line of the Denver & Rio Grande, 2 miles north of Ouray; capacity, 150 tons per day.

Judge Stevens has decided a question of importance to local mining men and of interest to mining men generally. In the action of the Treasury T. M. & R. Co. against the owners of the Corn Cob lode, the court held that under the laws of the State the company had the right to condemn a right of way across the Corn Cob lode under the eminent domain act. This assures the further prosecution of the tunnel and gives hope for other like undertakings that have been delayed by owners who would not consent to their property being crossed by a tunnel.

PITKIN COUNTY.

Men at the Gold Cup mine are at work in the ninth level. Pearson & Eckbert have a lease on the Dunraven property. A tunnel for the Taylor Park road will run on the pass between St. Elmo and Tin Cup. The Colorado S. & M. Co. will extend the North Halls Gulch tunnel 700 feet more. Air drills will be used.

SAGUACHE COUNTY.

(Special Correspondence).—The Colorado Mines Consolidated Co. of Colorado Springs has completed a 50-ton concentrating mill on its property at Cochetopa. Tests show that nearly all values can be extracted. They have 5000 tons of ore on the dump. The tunnel is in 1000 feet. A winze is being sunk. The values increase with depth. The company have twelve claims. They are also doing considerable work on their property at Whitehorn and have made connection with the shaft through the tunnel. A large body of hard carbonate with black manganese is exposed. C. F. Rickey is president, J. McConaghy general manager.

Whitehorn, Nov. 14.

Near Bonanza, J. D. Baldwin of the Rawley M. & M. Co. will have forty men at work.—The Juretta, under the management of J. E. Ashley, is running a crosscut.—Superintendent D. I. White-man at the Eagle mine is down 300 feet and working in manganese ore.—Superintendent Wm. Raworth of the Little Sister G. M. Co. will develop the group by a long tunnel, which will give a total depth of 1200 feet and open up bodies of ore.

SAN JUAN COUNTY.

(Special Correspondence).—The Sloux M. Co., at Eureka, will work by contract this winter, by tunnels, the Toltec, 200 feet long, and the Mogul, 500 feet long. Manager E. C. Condit will erect a new mill.

Eureka, Nov. 15.

O. Mears is reported to project consolidation of many of the mining interests of Red Mountain section and the connecting of Silverton and Lake City by railroad. This would mean the running of the long tunnel from below the Meldrum tunnel, to cut the higher mines about 1400 feet deep.

Manager Lacy will operate the Emma mine in Ice Lake basin all winter.

The Revenue at Ouray has finished its tunnel to the Telluride side, 4000 feet. Ore was struck near the apex.

E. H. J. Amy, in the Governor, South Lookout mountain, has the tunnel in 1000 feet.

Supt. Umbel of the Henrietta mine says that the breast of No. 1 level is in ore 11 feet wide, No. 2 in ore 9 feet wide, and No. 3 in ore 18 feet wide. It is not necessary to drive them any farther until after a mill is in operation, as the ore taken out in development work has to be thrown on the dump when it should be run over the tram into the mill or to the railroad cars for the smelter.

B. Mattiotti, foreman Japan mines, is driving a crosscut tunnel on that property, 8 feet high, 7 feet wide, a 2-foot ditch at the bottom and side of tunnel, objective point Japan vein, distance of 2700 feet from its mouth. With machine

drills propelled by air he has averaged 10 feet a day, and is now in 1550 feet, with 1150 more to drive to cut the Japan vein 850 feet below the surface and 640 feet below the point where the upper crosscut tunnel intersects the lead.

The mill and tram line of Silver Ledge M. & M. Co. at Chattanooga is in operation. The company expects to maintain a daily production of 100 tons ore.

G. W. Crawford has bought the Yankee Girl, the Vanderbilt, the Guston, the National Belle, the Charter Oak and the Hudson, and has organized a company to operate them. It is understood that he has also bought the railroad running from Silverton to Red Mountain. The Monmouth tunnel, planned to go through Red mountain, will cut these properties. The tunnel begins on the eastern side of Red mountain and will be 2 miles long. At the center of the mountain it will be 3000 feet below the surface. Before reaching the properties it will cut through the Henrietta group, owned by Kendrick & Gelder, the Congress, the Oliver and the Monmouth properties.

T. Clarke is putting in a 250-light plant at the Highland Mary.

SAN MIGUEL COUNTY.

Manager Jno. Herron of the Tomboy properties, in a report made Oct. 20, shows an output for the fiscal year ending June 30 of 85,726 tons ore; average value, \$9.98 per ton; gross yield, \$856,064.50; to mine and mill this ore cost \$505,747.67; average \$5.85 per ton, giving average profit \$4.13 per ton; aggregate net profit for year ending June 30, \$354,310.83. The new 60-stamp mill cost \$150,000, of which \$70,000 is included in last year's expense account. The crushing department of the mill was started October 20, and on the 3rd inst. the whole plant was in operation, and is now daily reducing 250 tons. Manager Herron says: "During the year the Tomboy proper produced 48,644 tons of ore, which yielded \$329,232.18, an average of \$6.77 per ton, at an expense of \$257,958.31, a profit of \$71,263.87."

The two Smuggler-Union mills at Pandora, 1 mile above Telluride, have a daily combined capacity of 400 tons. The mills are supplied principally from the Smuggler-Union mines, though the Contention mine, in Bear creek, connected with one of the mills by an aerial bucket tramway 2 miles in length, has been furnishing sixty tons ore daily. This property has been supervised by F. K. Borrow of London, who last week resigned to go to South Africa to take the management of a mining property there. The Smuggler Co. bought that property years ago for a consideration of \$125,000, and has kept thirty men employed in development. In addition to the Smuggler vein the company owns the Pennsylvania lead, which crosses it at an angle of 15°, and on which a tunnel has been driven 3000 feet; from its mouth the new tramway runs to the mills.

SUMMIT COUNTY.

Manager Griffith will resume work for the Augusta M. & M. Co. on the Juventa property at Lincoln.

In the Wiltch's Head mine, at Montezuma, Russell & Stewart have a 2-foot vein of 800-ounce silver ore.

TELLER COUNTY.

D. Hanley, manager Cripple Creek Enterprise M. Co., expects to catch the Abe Lincoln vein of the Stratton estate.

At Cripple Creek, in the civil suit of the Rio Grande Sampler vs. Stumpf & Myers, resulted in a verdict for the Rio Grande sampler for the amount sued for, \$1292. It was alleged by the Rio Grande and Eagle samplers that Stumpf & Myers and Kelley had salted ore shipped from their lease on the Gold Sovereign, and that the samplers named were out several thousand dollars each. The Rio Grande sampler attached money deposited by Stumpf & Myers in the bank, thus the civil action that has been decided in favor of the sampling company.

The Victorator, Anaconda and Rebekah mines, Cripple Creek district, have signed contracts to ship their product to the United States and Standard Reduction companies' mills for four years, beginning Jan. 1, 1903. The aggregate tonnage from these mines is about 4500 tons per month. Manager MacNeill says the company is now considering plans for the erection of a \$100,000 electrolytic plant at Colorado City. The new plant will assay the manufacture of chlorine gas by electricity, the process to be used in conjunction with the two large chlorination mills now in Colorado City.

The Golden Cycle property shows production of 125 tons of ore per day running \$20 per ton.

Five feet of 2-ounce ore is reported on the Tom Bigbee, on Squaw mountain.

Work on the Pauper is resumed by the Practical L. Co.

In Cripple Creek, sixty tons is the daily output of the Mary McKinney. No attempt will be made to work below the 500-foot level on account of the water. A new

pump, capacity 2000 gallons a minute, will be installed at a depth of 800 feet. In the north the ore shoot has been proven up 2500 feet. The ore will average \$30 a ton.

At Cripple Creek the El Paso Co. will start a tunnel 4000 feet west of the present El Paso shaft, 4 1/2 feet in the clear. The El Paso has abandoned its old shaft and will hoist everything through its new one. The property is producing twenty-five tons of ore daily, which goes to the smelters.

The Woods Investment Co. will drive 100 feet more in the May Belle tunnel, located on the Lawrence townsite.

IDAHO.

ADA COUNTY.

The Dalse mine at Neal is sold to F. T. Day, representing the Western Loan & Guaranty Co. of Chicago, for \$225,000. An independent company will be organized to work the property.

BLAINE COUNTY.

The Croesus, at Hailey, is closed down pending the installation of a new hoisting and sinking plant, when sinking is to be summed.

BOISE COUNTY.

The new stamp mill on the North Star, near Boise, in Boise county, is in operation.

The New England Co.'s small dredger at Idaho City will continue work through the winter. It has been running with profit for the past four years. The company has a large shovel dredger half a mile farther up the creek, but it does not do as good work, taking the season through, as the small one.

Manager Ingle still has men at work in the Twin Sisters quartz mines, 1 mile east of Centerville. There is a shaft down 400 feet, from which considerable drifting has been done. A large portion of the values is contained in tellurides.

Men are at work in the Lincoln mine at Pearl; the mill is completed.

The dredger on Granite creek, 1 mile west of Placerville, is still running day and night successfully.

On Miller mountain, T. B. Coe, manager Nampa M. Co., has men on the Magnolia and Monica groups. He is locally credited with intent to put in a mill in the spring.

Buchanan & Bettcher have leased the Blaine mill and are running it.

M. M. Gibson of Boise says he will put in a smelter at Idaho City.

CUSTER COUNTY.

It is now a settled fact that the White Knob Copper Co., operating mines and a matting plant at Houston, will build a road from Kelton, Utah, to the mines.

ELMORE COUNTY.

The Bonaparte mine has been bonded by New York people. Work is to be resumed in the spring.

R. P. Chattin has bought the Franklin mine at Pine Grove and has men at work mining and milling ore.

Near Mountain Home, D. Kerby, superintendent Monarch mine, has struck the ledge at the 600-foot level. A. Davis has his Uba stamp mill running. Men are at work at the mine.

IDAHO COUNTY.

H. Mabin, a returned prospector, tells the Spokane Spokesman-Review that 200 men will winter in the Thunder Mountain district. The trails are closed to the transportation of supplies. There were 3 feet of snow on the Elk creek summit two weeks ago.

Ledges of unusual width are found in the Big Creek district. The ore bodies have an eastern dip and in some instances are 600 feet wide. The values are gold and silver, with some copper and lead. A number of claims will be worked this winter.

Hunter & Watson have bonded the Crown group, on Logan creek, and will employ fifteen men. They have taken in ten tons of supplies for the winter.

The town of Roosevelt has taken precedence over the other boom towns and now has a population of about 150.

OWYHEE COUNTY.

The Pauper mine at Silver City has resumed work after a shut-down of nearly a year.

SHOSHONE COUNTY.

Near Wardner, after over four years continuous rock cutting, the Bunker Hill & Sullivan Co. has connected every opening in its mines with the long tunnel, the mouth of which is at the mill, 2 miles below.

Wallace says the number of men working in the Coeur d'Alenes now is from 350 to 500 more than last year at this time. It is estimated that 3000 men have employment at the present time in the mines there. At Wardner mines, 1000; up Canyon creek—Tiger-Poorman, 50; Mammoth, 140; Hecla, 100; Standard, 245; Frisco, 250; at Mullan—Morning, 250; Hunter, 50; at the California (up Nine-mile),

45; at the sampler below Wallace, 35; at the mines at Murray and prospects (estimated), 400; at Hercules, 50; and the estimate of prospectors working their own claims throughout the district places the number of men at 3000.

Superintendent G. T. Edmiston is locally credited with intent to put 280 men at work on the Frisco mine and run the property to its full capacity, which would mean a concentrate output of 2000 tons per month, the mill having a daily capacity of 650 tons crude ore. Starting the Frisco means increased trade for Gem, where the mine is located.

Reports from the Cœur d'Alenes that mineowners there are planning to cut wages are denied by the operators. Wages in the Cœur d'Alenes are a minimum of \$3.50 for all men underground, except at Gardner, where the pay is \$3.50 and \$3. The day shift is ten hours and the night shift nine hours.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla C. M. Co. has declared a regular quarterly dividend of \$5 per share, amounting to \$500,000, payable Dec. 10, equivalent to 20% on the stock. This, with the \$5 dividends paid in August and May and the \$10 dividend paid in January, makes a total of 100% for this year. In 1900-01 the company paid 260%; in 1899-1900, 320%; in 1898-1899, 280%. In 1897-1898 the dividends were 160%, in 1896-1897 120% and in 1895-1896 100%. The dividends declared and paid to date by the Calumet & Hecla aggregate \$79,850,000. The dividends declared and paid to date by the old Con. Virginia and California mining companies and the present Con. Cal. & Virginia M. Co. amount to \$78,213,600. The Calumet & Hecla is still paying dividends; the Con. Cal. & Virginia is not.

MISSOURI.

JASPER COUNTY.

Conditions in the Joplin district are reported to be the most prosperous ever known. While ore is not so high as during the boom period of 1899, it is within \$5 or \$6 per ton of the average high market during that period, and fully \$12 a ton above the average market for the past ten years. The output for ten months ending October 31 amount to 454,000,000 pounds of zinc and 54,000,000 pounds of lead, which has sold for a total value of \$3,100,000. This amount exceeds by \$1,500,000 the cash value of the production for the corresponding period of last year. Zinc ore remains strong and steady at a \$35 basis, although some lots have been purchased at a price indicating a \$36 basis, while some lower grade ores have sold at prices equivalent to a \$34 basis. The market for lead ore remains strong and unchanged at \$49 50 per ton.

MONTANA.

FERGUS COUNTY.

At Helena the Chicago-Montana G. M. Co. is incorporated; C. D. Stephens, C. A. Denham and J. M. Carls, all residents of Chicago. The company propose to mine in Fergus county.

GALLATIN COUNTY.

The Anaconda M. Co., which bought the mines at Storrs a few months ago, is building 100 coke ovens and in addition to this and the work in the mines it is making a town near the mines. The company has about 150 men developing its coal mines and expects to increase the force as soon as the mines are better developed. No shipments of coal have been made. It is the intention of the company to make coke out of the product of the property.

GRANITE COUNTY.

The Montana G. M. Co. at Royal, operating the Sunday mine, is shipping gold to Helena.

JEFFERSON COUNTY.

The East Helena S. Co. is working an iron mine located near the summit of Elkhorn mountain. The product goes to the smelting plant of the company.

During October twenty-six mining claim notices were filed for record in Boulder. In one it was stated that the locator had discovered a valuable deposit of steel.

Basin reports that the Boston & Seattle M. Co., operating a group of mines in Jack Creek district, contemplate building a railroad to Basin and erecting a smelter. They will continue development work on the properties and put in machinery to treat the tailings dump there.

A. Ray has a lease and bond on the Buckeye mine, Cataract district, 3 miles north of Basin.

D. J. Sweeney of the Silversmith says the paystreak has widened out to 22 inches.

Operations on the Elkhorn mine in Jefferson county have been suspended by the Longmaid Brothers, of Helena, who have the property under lease. Final shipments of ore from the mine are now being made. The pumps have been pulled from

the shaft, but the workings are in good shape, and should the price of silver advance a few points the property might be started up again.

LEWIS AND CLARKE COUNTY.

The Providence M. Co. has incorporated; W. Swan, L. Buskett and J. R. Lockwood.

The Boston M. Co. has been organized to work the Mohawk, Snowbird and Badger claims near Corbin, 16 miles from Helena. H. Freyler of Corbin is manager. He will sink 200 feet on the Badger and crosscut the vein, which is 8 feet wide, with 2 feet of ore on the hanging wall. The ore assays 7% copper 11 ounces silver and \$2.50 gold.

MADISON COUNTY.

Fine and Schulenberg will operate their group of mines near Mammoth and run a tunnel that will tap several veins.

W. B. Millard, manager the Kennett M. Co., has a lease on the Shafner mill until August 1, 1903, and will add a concentrating plant. Ore from the Kearsarge mine is to be run through the mill.

MISSOULA COUNTY.

The Eureka M. & S. Co. is buying the Black Lead group of mining claims for \$100,000. The group is at the summit of the Bitter Root mountains, on the headwaters of the north fork of the Clearwater, 150 miles east of Lewiston, Idaho. Assays show 10% copper and \$10 gold and silver values per ton.

Manager E. W. Conrad of the Bald Mountain M. Co., Saltese, says work there proves the existence of copper veins, which are being exposed whenever greater depth is reached. The company is running a tunnel calculated to intersect its ore bodies at a depth of 650 feet. It will have a length of 1000 feet. This distance has been driven.

The Richmond & Monitor has passed into the hands of Minnesota and Montana mining men. Superintendent Cooney is sinking double-compartment shafts on each of the veins. The Monitor shaft is down 200 feet. The force of twenty-two men will be increased to thirty.

SILVER BOW COUNTY.

The Jennie Dell M. Co. is developing the Jennie Dell claim, west of Walkerville. The shaft is down 225 feet. The vein is supposed to be a continuation of the Blue Wing, of the Alice M. Co. The ore of the Blue Wing carries \$15 gold per ton and 30 ounces silver.

The Ophir mine, at the foot of Dakota street, Butte, is being unwatered. There are twenty men employed. When the water is out of the lower workings the number will be increased to forty. The object is to sink the shaft several hundred feet more with a view of finding copper veins.

The hoisting works of the Alice M. Co., recently destroyed by fire, have been rebuilt and operations resumed. Later the property may be equipped with machinery capable of working at a depth of 2000 feet.

In Butte W. A. Clark will reopen the Travonia mine, which is being unwatered. He contemplates reopening the Black Rock mine, northeast of Butte.

Superintendent A. Clark has resumed work on the Ophir mine. Additional men are at work in the West Stewart mine.

NEVADA.

ELKO COUNTY.

The Dexter-Tuscarora Co. shows production during the year of \$130,000, profit \$23,000, from 30,090 tons of ore. The total indebtedness has been reduced to \$9000 during the year.

EUREKA COUNTY.

Ore shipments by rail from Eureka district for the week ending November 14 were: Eureka Con., 147,660 pounds; Diamond, 62,680 pounds; Jackson, 33,720 pounds.

HUMBOLDT COUNTY.

The Foltz placer mine of Spring Valley, is reported sold to Chicago men for \$40,000.

LINCOLN COUNTY.

The Searchlight Parallel G. M. Co. is incorporated to work mines in Searchlight, the directors being Los Angeles men.

At the E. & F. Co.'s properties at Pioche, Manager Freudenthal says there are two classes of ore—one of them headed by copper and the other by silver—and while they occur in the same ledge, the channels are distinct. The latter shows 90 ounces silver, with an average of 18% lead; the copper ores show 25% of that metal, with an average of 25 ounces silver.

LYON COUNTY.

F. Leonard Jr. of the Gold Canyon Tunnel Extension Co., which proposes to extend a branch of the Sutro tunnel to Silver City district, is reported to have assurance that the funds guaranteeing the construction of the branch tunnel have been subscribed in New York, and that

as soon as the rest of the signatures of the mine owners necessary to the agreement can be obtained work will begin.

NYE COUNTY.

Manager Healy of the Salt Lake & Tonopah Co. is delivering high-grade ores at Sodaville. Underground work shows ores that carry 100 to 300 ounces silver per ton, with corresponding values in gold. The vein is from 4 to 7 feet between walls.

The Halifax-Tonopah Co. will sink a 600-foot shaft at Tonopah. I. Mackay superintendent.

A new steam hoist for the West End shaft at Tonopah is on the way. The shaft has been enlarged to 4x7½ feet. B. F. Edwards is manager.

An ore strike is reported in the bottom of the 390-foot New York shaft.

Operations have been resumed on the Homestead, the main shaft of the Little Tonopah Development Co.

The main shaft of the Tonopah City Co. will have a hoisting plant capable of sinking 1500 feet. The shaft is down 345 feet.

The Ohio-Tonopah shaft is below the 300 level.

The Butte-Tonopah M. Co., T. L. Oddie manager, has temporarily closed down, awaiting a steam hoist. It is the intention of the company to sink 500 feet and crosscut to the east.

The Miner says the management of the Tonopah Co. has decided to employ but two shifts of men each twenty-four hours, the day men working nine hours, the night shift eight, as heretofore.

The Tonopah M. Co. reports that only such ore has been taken out as was located in the line of development. This development work has produced as much first and second-class ore as it has been possible (together with what the lessees have offered for shipment) for the present transportation facilities to move to the railroad, and in addition to this quantity there has been placed on the company's dump 7000 tons of ore, graded as third-class.

From 500 assays taken daily this tonnage averages \$61 per ton. The company's main working shaft is on the Mizpah claim, 200 feet distant from the ledge at the surface. It is a three-compartment shaft, 5x17 feet, and has been sunk 515 feet.

It is proposed to continue sinking this shaft to a depth of 1000 feet. At the 500 foot level a station is being built. The Valley View shaft is near the center of the Silver Top claim and has been sunk 310 feet. At 340 feet it will encounter the crosscut now being run from the main working shaft at the 300-foot level. The Desert Queen shaft on the upper end of the claim of the same name is down 315 feet. At a depth of 414 feet it will be on a line with the 300 foot level of the main working shaft. All leases to operate the ground of the company have been terminated. The company itself is the only one performing any mining operations upon the property.

During the past four months the returns received from the smelters, after deducting freight and treatment charges, have amounted to \$450,000, more than one-half of which amount was for lessees' ore (taken out prior to expiration of their leases, Dec 31, 1901), out of which was deducted the 25% due the company and the balance was paid lessees.

WASCO COUNTY.
John Sparks says he will incorporate the Wedekind mine near Reno.
Manager Hopkins has three shifts of miners in the Great Western property at Steamboat Springs. The lead carries \$6.

WHITE PINE COUNTY.

The New York & Nevada M. Co. pays \$35,000 for the waters of Murray creek, near Ely.

NEW MEXICO.

GRANT COUNTY.

D. Burman claims that in his section "10% copper ore cannot be mixed at a profit. The smelter at El Paso pays \$1.45 a unit for copper. Ten per cent copper ore brings at the smelter \$14.50. Allow \$2 a ton for wagon haul from the mine to the railroad and \$2 50 for railroad transportation. When the smelter charges 12 cents for each per cent of silica in the ores, if the ore carries 70% silica the charge by the smelter is \$7.40; wagon haul, transportation and smelter charges total \$12.90. Deduct this from \$14.50, the total value of the ore, and there is left \$1.60 for mining. As the result of these prices, we have closed down our mines in New Mexico."

LINCOLN COUNTY.

S. B. Wise, for the Free Gold M. Co. at Juana canyon, Jicarilla district, will put in four concentrators, combined capacity 200 tons per day. The company have eight placer claims in Juana canyon and are drilling for water.

OREGON.

BAKER COUNTY.

T. R. Packard of Boston has bought the

Del Monte, near Sparta—four claims, on which much development work has been done.

The third rich ore shoot has been opened in the 900-foot tunnel of the Belcher mine.

The mill at the Cracker-Oregon mine is completed. The framework is done and the siding is up. Work on the interior is progressing rapidly. Upraises are being started to block out the ore.

The new stamps at the North Pole mill are in.

J. W. Larkin, managing owner of the Cougar, is resuming operations. R. A. Marr will have charge of the mill.

Superintendent E. J. Thorp of the Blue Bird M. Co. is crosscutting. The compressor will be installed Dec. 15.

JACKSON COUNTY.

Near Gold Hill, Superintendent Jackson is developing the Bouden and Yellow Jacket, getting ready for new drills and hoisting works.

Superintendent Phelps, at the Anderson mine on Foothills creek, has a vein 2 feet wide at a depth of 135 feet which goes \$25 to the ton.

Superintendent A. Orme has men putting the Ray mine in condition for a new 20-stamp mill.

Superintendent Mendenhall is putting in a gasoline engine at the Roaring Gimlet mine.

JOSEPHINE COUNTY.

The Harmon-Green placer on Galice creek has begun piling. The ground to be worked this winter consists of bars along the east bank of Galice creek 1 mile below the forks. The gold is coarse and of high quality.

The Wolf Creek M. & D. Co. has a large force at work on its quartz and placer properties. Besides four claims this corporation has 180 acres of valuable placer ground and water rights on Wolf creek. New ditches are being dug and flumes built, and three ledges are being faced off preparatory to driving a main working tunnel.

The Golden Drift M. Co. is building a power dam across Rogue river, 3 miles above Grant's Pass, and putting in immense gates and digging out the race and bays for twelve turbine wheels. The dam is built across the river; all that remains to finish its construction is to build it up the required height, giving a 20-foot fall to the water. The twelve turbines will develop 5000 H. P. The power house will contain two sets of pumps, one of which will force the volume of water to the giants in the placer diggings of the company, and the other will lift the water to three irrigating ditches.

MALHEUR COUNTY.

E. A. Hutchins, at Shasta creek, is developing a group of claims on the porphyry dyke in extension of the Black Eagle, where a 20-stamp mill is building. A 4-inch seam of ore has been traced through the eight claims on the dyke.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Three mining companies are working within 1 mile of Cyanide, two of them—the Spearfish G. M. & I. Co. and the Deadwood-Standard M. Co.—producing bullion, and the third—the Potsdam G. M. Co.—is in the development stage. All three companies are working on the limestone plateau near Ragged Top mountain. The two former have cyanide plants and the latter is preparing to build one. The Spearfish Co. is daily reducing 300 tons of ore. The cyanide plant of the Deadwood-Standard Co. is treating 125 tons a day.

There have been thirteen mine accidents resulting in loss of life and nine resulting in serious bodily injury in the Black Hills during the ten months of 1902, according to the report of the State mine inspector, T. Gregory.

The bullion production for the ten months of 1902 is \$7,342,216 56, as against a little over \$3,000,000 for the twelve months of 1901. The ore tonnage and gold bullion output of the different mines for the past ten months have been as follows:

Mines.	Tons.	Value.
Homestake.....	1,218,089	\$4,303,977 57
Golden Reward.....	161,000	1,223,688 99
Horseshoe.....	45,000	575,000 00
Holy Terror.....	15,000	180,000 00
Portland.....	12,000	84,000 00
Clover Leaf.....	20,800	80,320 00
Dakota.....	36,623	150,000 00
Rooster.....	15,000	90,000 00
Wasp No. 2.....	25,000	75,000 00
Imperial.....	25,000	180,000 00
Spearfish.....	23,000	165,000 00
Deadwood—Standard.....	5,000	20,000 00
Golden Slipper (estimated).....	20,000 00
Placer (estimated).....	100,000 00
Alder Creek.....	10,800	46,231 00
Miscellaneous.....	50,000 00

Totals.....1,612,312 \$7,342,216 56
There are 3207 miners and millmen em-

played around the various mines of the Black Hills, of which the Homestake employs 1700, the Golden Reward 400, the Horseshoe 200 and the Imperial 100. These four companies are the largest employers in the region.

The Jupiter G. M. Co. has a two years' bond and lease on the mining property and 40-stamp mill of the Boston-South Dakota M. Co. in Blacktail gulch. J. Hartgering will build a cyanide annex of 150 tons daily capacity.

At Deadwood the directors of the Black Hills Mining Men's Association have organized by the election of the following officers: H. Franklin, Deadwood, president; G. M. Nix, Lead, first vice-president; S. W. Russell, Deadwood, second vice-president; J. E. Pilcher, Custer, third vice-president; W. S. Elder, Deadwood, secretary and treasurer. These are the officers who served last year with the exception of third vice-president, that office not being filled at the organization a year ago. Other directors of the Association are J. Gray, Terraville; J. Blatchford, Terry; C. H. Fulton, Rapid City. The executive committee of the Association has the work of preparing for the entertainment of the American Mining Congress in 1903 well under way, and has raised sufficient money to more than meet the pledges given at the Butte session of the congress. A committee has been appointed by the chair on mines and mining, the work of this committee consisting chiefly of investigating the operations of various mining companies that are in process of promotion and selling stock, this being done with a view to protecting outside investors. The fundamental principle of the Association is to keep mining on a par with other lines of business as to honor and integrity.

At Lead the Hidden Treasure Co. is placing machinery at the Bingham shaft. Development work continues on the Baltic tunnel of the Hidden Fortune. The tunnel is now in over 2000 feet and there are five crosscuts to the right and left, penetrating the parallel veins of ore between which the main tunnel is being driven.

A shipment of ore is being made ready on the claims purchased by the company of O. P. T. Grantz. Several hundred tons of the ore is in sacks and the company is taking out a ton and a half a day that will, it is reported, average \$1000 a ton. It is estimated that the shipment about to be made will bring \$30,000. It will be sent to a smelter at Denver.

The Horseshoe M. Co. will begin work on its new cyanide plant at the Mogue mine, near Terry. W. H. Elliott is foreman for the Horseshoe Co. on the work it is doing west of the Spearfish. The new cyanide plant will require 3,000,000 feet lumber, capacity 1000 tons a day. The contract requires completion by Jan. 18. The plant is to be connected with the various mines of the company by an aerial tramway system. The company has lately enlarged the Pluma cyanide plant from 100 to 300 tons a day, and is running it regularly on ores from the Ruby Basin and Bald Mountain mines. Only the medium grade ore is being cyanided, the company shipping the better grade material to the smelter lately purchased of the National Smelting Co. at Rapid City, which is running full capacity of 300 tons a day, largely on Horseshoe ore, with some custom.

PENNINGTON COUNTY.

R. M. Maloney at Sheridan will resume work on the Maloney Blue Lead group. Three shifts of eight hours each will be put to work before the end of the week, and the drift will be extended 700 feet farther.

UTAH.

JUAB COUNTY.

At the Utah mine, Supt. C. Crismon, at Fish Springs, says on the 300-foot level samples show 500 to 1000 ounces of silver to the ton.

The new aerial tramway of the Grand Central at Eureka is in operation.

SALT LAKE COUNTY.

The U. S. smelter is in operation.

SUMMIT COUNTY.

The Little Bell of Park City will sink its 300-foot shaft 200 feet more, followed by drifting and raising on the ore in the drifts in the 300 level.

Supt. Mixer of the Creole of Park City has ore that shows ten ounces silver, 20% lead, \$2 gold per ton.

Manager Dodge is pushing the tunnel project of the Southwest Quincy M. & T. Co., which starts in Pine canyon and heads for the Quincy and Daly-West, nearly a mile. It will run through about thirty claims belonging to the projectors; the depth will average on the thirty claims 1750 feet. The tunnel is in 300 feet, and its course will tap the Superior, Copper Queen and other ledges.

The American Flag Co., Park City, has

started its new hoisting plant. The high-grade rock is being sacked.

TOWNE COUNTY.

The Con. Mercur in the face of the Electric tunnel is beneath the boundary line of the Ingot property, where ore equal to any of the bodies of that property has been tapped. Connection will be made with the tunnel from the Ingot shaft.

WASHINGTON COUNTY.

At St. George the Silver Reef Leaching Co. have started their plant on the tailings at the Christy dump.

WASHINGTON.

FERRY COUNTY.

C. P. Robbins of the Lone Pine-Surprise Co. has returns on fifty tons of ore sent to the smelter, which showed values of \$24.36—\$22 40 gold and \$1.96 silver. The ore was broken down in timbering.

OKANOGAN COUNTY.

Manager G. Wehler of the Nighthawk and Favorite mining companies, near Loomis, is sinking on the first ledge on the Nighthawk. The tunnel at the Nighthawk is in 674 feet.

Manager Lewis is driving a tunnel on the Mammoth. From Oct. 15 to Nov. 1 he had made 40 feet in slate.

SNOHOMISH COUNTY.

The Index Independent Con. M. Co., 5 miles east of Index, has a working tunnel and a drift from the crosscut, the face of which is now within 150 feet of the ore shoot.

WYOMING.

CARBON COUNTY.

A group of locations, comprising 360 acres adjoining the Ferris-Haggerty property, is bought for \$150,000 by Utah men, including Messrs. Kearns, Bamberger, Keith, Newhouse and Dickson.

FOREIGN.

BRITISH COLUMBIA.

Thos. Drummond of Keithley creek and Forks Quenesling divisions of Cariboo district says he has fitted up the Norberry dredger and started it to work.

E. B. Kirby, manager Center Star and War Eagle mines, concerning local report of the sale of the Canadian Pacific Smelting Works at Trill to the Gooderham-Blackstock syndicate alleged to have occurred, says there is no truth in the story.

T. Jones, representing the zinc smelting works of Iola, Kas., has been looking at the Pilot Bay smelter, and says that if satisfactory arrangements can be made a combination of that plant with that of the Kaslo sampling works is probable, the Kaslo plant to be used for the partial treatment of zinc ores of that district preparatory to their shipment to the Kansas works at the \$11 rate lately offered by the railway company.

W. Y. Williams, superintendent Granby mines, expects to be able to double the present rate of ore shipments to the company's smelter at Grand Forks this week. At present the rate is 750 tons per day.

Forty actions for damages against the Crow's Nest Pass Coal Co., aggregating \$500,000, growing out of fatal explosion last May, will be heard in the Supreme Court next January.

The Golden smelter is to be operated by water power and is to cost \$20,000. A laborers' co-operative company is the promoter.

The Mines Exchange, Ltd., Nelson, reports in Nelson mining division a strike on the Gold Hill location, at the head of Forty-nine creek, 12 miles from Nelson.

The 6-mile wire cable for the Venus-Athabasca tramway has been hauled to the property.

The Highland mine is employing sixty men. Twenty tons ore is the daily average treated.

On the the North Fork of the Salmon river on the Relief there are twenty-five men working. The 10-stamp mill is in operation. On the Arlington there are twenty-seven men at work.

There are about thirty men placer mining along the North Fork.

The stamp mill at the Wilcox mine, near Ymir, will be in operation next month.

In Lardeau thirty-five men are employed on the Oyster-Criterion. A tramway and mill will be installed in the spring. The property is an extension of the Eva lead.

At the Great Western mine five drill compressors have been put in.

J. Wardner has an option on the Morgan group.

A meeting of the local miners of the Slocan was held at Sandon on the 20th inst. to consider a proper presentation of the lead situation and the means for get-

ting better prices to W. A. Galliher, K. C., M. P., who is to take up the matter at the next meeting of the Dominion House of Parliament. C. X. Hardy of the Rico mine, George Hughes of the Sunset and A. C. Garde of the Payne constituted the committee who had the meeting in hand. G. B. Roden, representing the American Smelting & Refining Co., is making an investigation of the silver-lead industry of the Kaslo-Slocan district, with the object of reporting on the feasibility of building a smelter here.

The Triune tramway is about finished. F. F. Fulmer and associates have full control of the Beatrice group, Mohawk creek, Fish Creek district.

In Slocan the Scottish Colonial Syndicate, owning a three-quarter interest in the Alma group of claims and concentrator, has bought the remaining quarter interest from G. Hughes for \$75,000.

Grand Forks reports that the coal miners' strike at Michel has had the effect of restricting shipments of coke to the Boundary district, and the reserve supply at the smelters is limited. The Granby plant for weeks past, owing to low water, has been running only two furnaces. A portion of coke used in the Boundary comes from Michel.

The transformers for the substation of the Cascade Power Co., at the Granby plant, means the addition of 100 men to the payroll; an additional 200 men will also be added to the payroll of the Granby mines at Phoenix.

The smelter plant at Marysville in the Lardeau will not be proceeded with this winter. All operations have been suspended and nothing is said as to a resumption. The characteristic ore of the Lardeau is silver-lead sometimes carrying gold. The plant was erected on the reverberatory system and it is said that while it would undoubtedly operate on gold-copper ores that it could not handle the silver-lead ores with marked success.

MEXICO.

Official figures show development of the mining industry in Mexico. During the ten fiscal years that began July 1, 1892, and ended June 30, 1902, mining titles to the number of 17,929, covering in total 529,670 acres, were issued. The greatest development has been made in the last three years.

GUANAJUATO.

G. W. Bryant is resident manager of the Aparecida Mines Co. of Guanajuato, which has 114 acres between the Rayas and Irena mines.

SONORA.

The Torreon Enterprise says that since the Guggenheims have failed to purchase the smelter there, they will construct a plant of their own there. It is apparently authentically stated that the new smelter which they will build will be of 1000 tons daily capacity. They have control of some leading mines at Velardena, Parral and Santa Barbara, which will give them sufficient ore to keep them running at full capacity.

The smelter at Cananea is shut down temporarily because of scarcity of coke.

PERU.

The American minister, I. B. Dudley, at Lima, in a report to the State Department, says: Owing to the fall in the price of copper the entire industry has undergone a certain paralysis, but it is expected that the energy and ability of Americans, who have established some of the largest plants in Peru, will contribute to the highest prosperity before long. The introduction of American methods of exploitation and of American machinery already have reduced the cost of production to a low figure, and the building of new railroads have enabled native miners to find a new and wider sphere for the industry.

SOUTH AFRICA.

From Johannesburg H. Kingsmill writes to J. J. Davis of Spokane: "Johannesburg is still under martial law and there is a very great scarcity of native labor for mines. Only 30% of what is required is available; there is a feeling of unrest among the large operators as to how much of a load the Imperial Government will put on the country for its part of the cost of the war. The military are using the railway transporting troops around, so that it is almost impossible to get supplies and freight up from the coast. It is a very expensive place in which to live. Board and room in a private family cost from \$45 to \$65 a month. I have been working in one of the deep levels stopping on the 2200-foot level of the Robinson deep. I am in charge of three Ingersoll drills. I don't like it much, as I speak but little Kaffir. I have ten negroes for the three machines. A few of them are good men, but the others are a lazy, shiftless outfit. The rock is not

hard, and is the most even drilling I have ever seen. All the machinery and most of the mine managers are Americans. I advise no one to come here looking for day's wages, although there are great openings for speculation in real estate."

RHODESIA.

The dry crushing process is in operation on the property of the Wanderer Selukwe Gold Mines, Ltd., erected by the London & Hamburg Gold Recovery Co., Ltd. After the ore has passed through the bin and grizzlies, it is conveyed to two stone breakers, which reduce it to small pieces. Then falling through chutes, these pieces are pulverized by roller mills. An elevator conveys the ore to the top of the building, from whence it further falls through chutes into two large revolving cylinders, which are heated by steam pipes and hot air. Here all the moisture is extracted from it, and it is then conveyed by an elevator to magnetic drum at the top of the building, where the iron is attracted. Passing through two revolving sieves, it enters the separating boxes, Spitzkasten, where a weak cyanide solution and revolving screws separate the slimes from the sands. The former, being lighter, rise to the top and are conveyed to the agitator vats. The sands, however, pass into the spitzen, where the coarse and fine sands are distributed to their respective cyanide vats. The ore which is too large to pass through the revolving sieves is pulverized again by a roller mill and undergoes the same process as after leaving the revolving cylinders. There are also large tubes which convey the dust to a special chamber where it is precipitated, and from time to time taken out to be treated by cyanide. In the agitator vats the slimes are agitated by large revolving paddles, to give the cyanide free play, and when they have been treated sufficiently the solution is conveyed to the precipitating house, while the refuse slimes are carried away in trucks. The coarse sand vats are divided into four compartments, revolving launders distributing the sands. Here the cyanide solution percolates through false bottoms constructed of layers of matting and boards, and is then conveyed by pipes to the precipitating house, while the sands are discharged by doors at the bottom into trucks below. The fine sand vats are provided with Butter's distributors, which, revolving, distribute it evenly. Here the solution percolates through false bottoms similar to those mentioned above, before being conveyed to the precipitating house. The cyanide house has precipitating boxes for the precipitation of the gold, while the cyanide solution is pumped into large sumps to be strengthened before being used again. This process, although intricate in comparison to the wet crushing, is said to be satisfactory in extracting the gold, and cheaper to work, as it requires less water, and less labor is involved.

TURKEY.

At present there are four districts in Turkey in which anyone who so desires may enter into the business of meerschaum mining simply by paying the Ottoman government the sum demanded for a license, namely, 5 piasters. These districts are Sari-Sou, Septedji, Gelkli and Menlon. The 5000 miners already engaged in this industry are Kurds and Persians, and all of them work according to the most primitive methods. They are formed into gangs composed of fifteen men at the most, under the authority of a sort of section boss. The first work done consists of sinking a well until the miners come to a reddish clay soil, which indicates the presence of the meerschaum, this latter being found at a depth varying from 10 to 200 feet. The meerschaum appears in the form of round lumps, more or less irregular in form, the size of which rarely exceeds 30 or 40 cubic centimeters, and the usual size of which is about that of an apple or a walnut. When they reach the bed the miners dig horizontal galleries through the red clay, and as there is no direction or plan pursued, the gangs frequently meet each other. The work is carried on night and day by means of petroleum lamps, the blocks of meerschaum being brought to the surface still embedded in their matrix. On the weekly sale day the workmen meet and sell their goods to the "luledjis," or pipe manufacturers of Eskichehir. The blocks are then taken to the town and washed, after which they are cut into suitable pieces while the matter is still very soft. Sorting and classing is then proceeded with, and the "luledjis" in their turn sell their purchases to the larger dealers, who export the meerschaum, carefully enveloped in cotton wadding.

Meerschaum is composed of about 70% of carbonate of magnesia, 25% of silice, and 5% aluminum.

Personal.

SAMUEL NEWHOUSE of Utah is in New York City.

W. W. OLIVER is foreman at the Mayer, Ariz., smelter.

WM. UREN of Idaho Springs, Colo., is at Kennet, Cal.

P. S. MUSSIGBROD of Garnet, Mont., is in New York City.

CHAS. KNIGHT is manager the Hub M. Co., Beaver, Utah.

L. U. LOOMIS is manager Gladstone M. Co., Pioneer, Mont.

C. D. LANE has returned to San Francisco from Nome, Alaska.

J. W. STARKWEATHER has returned to Denver, Colo., from Mexico.

W. L. COOPER is manager the Progressive M. Co., Leadville, Colo.

GEORGE TEAL is now manager Livingstone mine, Wall Street, Colo.

C. C. BOURNE has organized the Bonito M. & M. Co., Nogal, N. M.

B. C. RIBLET of Nelson, B. C., has returned there from Denver, Colo.

G. W. NELSON of Denver is examining mining properties in New Mexico.

P. SHEEHAN is superintendent Jonny mill, Stateline, Iron county, Utah.

D. WARD of Georgetown has charge of the Gold Dirt Co. at Empire, Colo.

J. K. MERRILL is manager Calumet & Arizona smelter, Douglas, Arizona.

O. A. PALMER of Salt Lake is testifying in a mining suit at Spokane, Wash.

L. F. BROWN is general manager Pacific Steel & Wire Co., Oakland, Cal.

G. F. COFFEY has returned from Dawson, Alaska, to North San Juan, Cal.

H. C. HOLTHOFF of Milwaukee, Wis., has returned there from Denver, Colo.

M. S. FALLIS of Denver, Colo., will have charge of the Metals Volatilization Co.

W. F. COLLINS of British Columbia is examining mining property in Colorado.

F. F. WEBER is assistant superintendent East Klondike mines, Nye county, Nev.

J. R. H. ROBERTSON of Denver is in San Luis Potosi, Mexico, for a few months.

D. McDONALD has resigned as superintendent New Era M. Co., Searchlight, Nev.

CHAS. ECKHART is superintendent Montana G. M. Co., Granite county, Montana.

F. E. WOODBURY has been appointed superintendent Quincy mine, Houghton, Mich.

L. W. ALDRICH of Denver will spend some time in Mexico looking after mining interests.

J. P. OWEN, manager Sierreta M. & M. Co., Oro Blanco, Arizona, has gone to New York.

L. B. JONES, superintendent Red Rock mine, Big Bug, Ariz., has returned there from Boston.

L. GREENGOOD succeeds J. Bartrem as superintendent Prosperity M. Co., Prescott, Arizona.

JAMES LINDSEY has returned to Portland, Or., from head of White and Copper rivers, Alaska.

W. H. HILL goes to Mellen, Arizona, to aid in the construction there of a 40-stamp gold mill.

H. E. NELSON, engineer with American S. & R. Co., Denver, has been transferred to Durango, Colo.

P. HAMPTON, formerly manager Dixie mine, Idaho, is now in charge of the Daisy mine, Neal, Idaho.

W. H. COX succeeds G. R. Hancock as superintendent White Knob Copper M. Co., Mackay, Idaho.

L. T. WRIGHT, general manager Mountain Copper Co., Keswick, Cal., has returned from England.

W. A. AKERS has returned to Salt Lake, Utah, from an examination of Montana mining property.

SUPERINTENDENT GENDER of the Trilune mine, Ferguson, B. C., will operate the property all winter.

S. GILMORE, late foreman Ready Bullion mill, Juneau, Alaska, has resigned and goes to South Africa.

F. T. LLEWELLYN succeeds G. F. Meehan as general manager Monterey F. & M. Co., Monterey, Mexico.

J. P. EVANS, of the Colorado Iron

Works Co., is installing a smelter for the Majestic Co., Milford, Utah.

J. T. THOMPSON, superintendent Kenross mine, Calaveras county, Cal., has returned there from New York.

F. L. SWEARS goes to Friena, Chile, S. A., as assistant superintendent of a gold and silver mining company there.

GENERAL MANAGER JAMES HUTCHINSON of the Trade Dollar Consolidated M. Co., Silver City, Idaho, has resigned.

J. W. SPAULDING, former superintendent Mellen M. & M. Co., Juneau, Alaska, has opened an assay office in Baker City, Or.

J. F. MORA is foreman Salvador mine, Jesus Maria, Calaveras county, Cal. He will enlarge the mill from ten to twenty stamps.

H. G. VERCOE, formerly in charge of Gavilan gold mines, Perris, Riverside county, Cal., is now superintendent Fresno Copper Co., Ltd., Clovis, Cal.

J. J. CHAMBERS has returned to Redding, Cal. In Canton, O., he formed another company to operate Shasta county, Cal., mining properties.

R. R. WHEELER, former superintendent Golden Cross mill, Hedges, Cal., is now master mechanic reduction division Cananea Copper Co., La Cananea, Mexico.

J. COLQUHOUN of the Arizona Copper Co., and A. McLean, superintendent Metcalf mines, are in Hachita, N. M., examining mines with a view of purchasing ores for the A. C. smelters.

W. OXNAM has resigned the superintendency of the mines of the Bully Hill M. & S. Co. at De Lamar, Cal. Superintendent Keating, superintendent of the smelter, is now in charge of the mine.

M. D. THOMAS, former foreman Trinity Copper Co., has taken the general foremanship of the Bully Hill mines, under the general superintendency of G. B. Keating, the latter succeeding W. Oxnam.

H. B. MAXSON of the surveying department of the U. S. Geological Survey is at Pioche, Nev., to receive a report from an engineering corps he has had in the field all summer and which has surveyed 250,000 acres unplatted land.

BERNARD MACDONALD has resigned his position as manager and consulting engineer of the Le Roi No. 2 mines at Rossland, B. C., and intends to open an office at Spokane, Wash., from which as headquarters he will carry on the business of consulting mining engineer after January 1st, 1903.

F. K. BORROW has resigned the superintendency of the Contention mine, San Miguel county, Colo.; goes to Buluwayo, Rhodesia, South Africa, to take a position with a mining company of which D. B. Huntley, formerly manager Tomboy mine, is now manager. C. H. Wittenoom accompanies him.

Commercial Paragraphs.

F. P. RUSSELL is manager Portland, Or., branch house of Henshaw, Buckley & Co., machine supplies; principal place of business, San Francisco.

H. CHAPPELL has returned to California from Mongolia, and is superintending the delivery of a large amount of machinery contracted for from the Daniel Best Co. of San Leandro, Cal., including several of their traction engines which have found such favor in this and foreign countries.

THE J. H. Montgomery Machinery Co. of Denver, Colo., write that they are working day and night shifts to complete several rush orders, which include a copper smelting plant for Monterey, Mexico, one of their patent 5-stamp mills for northern Idaho and a supplementary order for twenty coal cars, to be added to the fifty recently ordered from them by the Black Warrior M. & M. Co. of British Columbia. They also report several orders for ore cars and buckets from Chihuahua, Mexico.

RECENT shipments made by the Colorado Iron Works Co. of Denver, Colo., are: One smelting equipment for Mynboun Maatschappy Soemalata, Amsterdam, to be shipped to the Celebes islands, Dutch East Indies; ninety-six water jackets for American Smelting & Refining Co. at Monterey, Mexico; fifty water jackets for the Globe Smelting & Refining Co., Denver, Colo.; one set 40x16 Improved Standard rolls for the Economic mill, Victor, Colo., making four sets of these rolls now in use at this mill; three iron-top Bartlett tables for Mexico.

THE Western Engineering & Construction Co., successors to Griffin & Cameron, Pacific coast representatives The Bucyrus Co., placer mining machinery, Robins

Conveying Belt Co., ore, stone and coal conveyors, 209-210 Safe Deposit Bldg., San Francisco, Cal., write that they have finished three dredgers in the Oroville, Cal., district within the last two months—one dredger for the Cherokee Dredging Co., one dredger for the American Gold Dredging Co. and one dredger for the Butte Gold Dredging Co.—and that they are at present at work on a large 5-foot dredger for the Leggett-Wilcox Co., Oroville, and on the second dredger for the Indiana Gold Dredging Co., Oroville. They state that they have also a contract for an electric transmission plant and dredger at Atlin, B. C.

Copper Statistics.

The monthly copper statistics, prepared by John Stanton, show that the production in October of United States reporting mines was 24,152 tons, and production from outside sources (estimated) 2100 tons, a total of 26,252 tons, or 464 tons in excess of the September production. The production of foreign reporting mines in October was 9707 tons, or 552 tons more than in September. United States exports in October were 12,515 tons, a decrease of 668 tons from September. The production in the United States mines compares as follows (in tons of 2240 pounds):

	1902-01.	1901-00.
October.....	26,252	24,098
September.....	25,788	21,580
August.....	25,206	22,667
July.....	26,749	21,985
June.....	26,740	22,401
May.....	25,763	22,392
April.....	24,624	8,810
March.....	24,035	23,384
February.....	20,331	21,100
January.....	18,955	22,679
December.....	19,803	22,124
November.....	21,728	23,276

Foreign production figures (in tons of 2240 pounds):

	1902-01.	1901-00.
October.....	9,707	8,960
September.....	9,155	9,477
August.....	9,504	8,180
July.....	9,210	9,254
June.....	8,202	8,522
May.....	9,354	8,456
April.....	10,169	8,810
March.....	8,979	7,817
February.....	8,475	7,332
January.....	7,367	5,910
December.....	8,677	8,483
November.....	8,864	7,752

Exports from United States (in tons of 2240 pounds):

	1902-01.	1901-00.
October.....	12,515	8,016
September.....	13,183	6,419
August.....	12,429	6,840
July.....	11,733	6,824
June.....	14,027	6,842
May.....	16,283	10,062
April.....	16,424	4,849
March.....	20,097	6,818
February.....	16,108	8,453
January.....	15,021	10,003
December.....	10,171	11,223
November.....	6,367	9,508

Catalogues Received.

"Labor-Saving Appliances and Power Transmission Machinery" is the latest of the Jeffrey Mfg. Co.'s issues—a solid, substantial little volume, 6x8 inches, 375 pages, portraying chain belting, steel cable, elevating and conveying machinery and innumerable other devices and apparatus of economic value to industrial workers, with illustrated description and price lists, finely indexed. Issued by the Jeffrey Mfg. Co., Columbus, Ohio.

"Jessop's Steel and How They Make It," is a dainty delineation of steel manufacture at Brightside, Sheffield, England, by William Jessop & Sons, whose record as successful steel makers runs back to 1774. Anyone not knowing anything of this leading firm seeing this little volume in olive and crimson would necessarily be favorably impressed, and a casual glance through its pages would further accord some down-to-date information on how good steel is made.

The latest 48-page catalogue of the Atlas Car & Manufacturing Co. of Cleveland, O., has several illustrated details of mine car construction of interest to any one having use for such devices. There is a wealth of suggestive detail embodied in different forms of mine cars, "soft mud car," "stiff mud car," "double deck car," "triple deck car," "mud rack cars," "dryer cars," "core oven cars," etc. There are thirty-two different designs of mine cars shown, beside turntables, portable tracks, etc., making a trade treatise on

mine cars worth noting. The two catalogues, 1008 and 1012, will be sent to any address on request.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BRIQUET-MAKING MACHINE.—No. 712,696. Nov. 4, 1902. R. Martin, San Francisco, Cal., one-half assigned to S. P. Smith of same place. This invention relates to a machine which is designed for the manufacture of compressed blocks or briquets of coal mixed with some binding material, so that the pulverized coal and binding material can be compressed into solid blocks of suitable size, shape and hardness, so that they break in handling and make them serviceable as fuel. The machine consists of a horizontally revolvable table having two sets of radially slidable plungers movable in line with each other by the action of suitable cams. Above and in line with the path of travel of the outermost plunger is an annular hopper into which the properly mixed coal and binding material are delivered, and the outer plungers move transversely across the channel which is filled from this hopper. The material is forced from this hopper into the mold by the movement of the outer plungers, and the outer ends of the inner plungers act as stoppers to stop the inner end of the mold, while the outer plungers are moved sufficiently to compress the material within the mold. Then the inner plungers retract while the outer ones continue to follow until the briquet is discharged from the mold into a space through which it may drop away from the machine.

ROTARY SCRAPERS.—No. 712,838. Nov. 4, 1902. R. H. McCaughey, Campbell, Cal. This invention relates to improvements in dirt scrapers. It is particularly intended for use in blocking up corners in orchards before irrigating. Its object is to provide a device which can be easily dumped and which will automatically right itself, allowing the operator always to remain hold of the handles. It consists of a scoop or shovel adapted to slide along the surface of the ground, handles pivoted to lugs upon the sides of the scoop, projections on the rear of the latter, spring-actuated latch members engaging said projections, one of said latch members connected with a hand lever upon one of the handles by which the latch may be released to allow the scoop to dump and the other of said latch members adapted to engage the scoop when the latter is again righted and hold it in proper relation to the handles.

OIL HEATING AND HEAT REGULATING DEVICE.—No. 713,345. November 11, 1902. G. Porter, San Francisco, Cal. This invention relates to an apparatus for applying the heat derived from the combustion of oil to galvanizing or metal coating tanks and in a means for regulating the application. It consists in an apparatus for melting metals, the combination of a centrally disposed melting tank, a wall surrounding the same and forming a channel between itself and the tank, said wall having openings slidable in line with it; a hollow conductor forming a closure for the top of the channel and having openings in its outer side connecting with said channel; and valves or gates mounted in said openings in the wall, slidable horizontally across the channel and having their inner ends adapted to shut endwise against the outer wall of the tank.

ROTARY ENGINE.—No. 713,301. November 11, 1902. J. C. Hagerty, Santa Cruz, Cal. This invention consists of a smooth circular disk eccentrically mounted within a circular casing, so that at one side the periphery of the disk forms a tight joint with the interior of the casing as the eccentric revolves, an abutment slidable in line with the shaft and means for moving it to maintain it continually in contact with the periphery of the revolving eccentric, means for admitting a medium under pressure upon one side of the abutment between the eccentric and the casing, so that the pressure will act upon the larger diameter of the eccentric, and means for exhausting the medium from the opposite side of the abutment. Also devices for adjusting the eccentric to maintain the joint between it and the casing, means for adjusting the mechanism by which the sliding abutment is actuated, and other details of construction.

STEAM GENERATING FURNACE.—No. 713,296. November 11, 1902. J. L. Groux, Jerome, Ariz. This invention relates to a combined furnace and steam generator. It consists essentially of a brick-lined crucible forming the lower part of the furnace, a water jacket section composed of boiler iron properly braced, with tyces through the inner and outer walls to admit air, has an inlet and outlet, and a water tube section located above the jacket and surrounding the furnace, said sections being connected with the water jacket below and a steam drum above.

RAIL JOINT.—No. 713,334. November 11, 1902. O. Niehaus, West Berkeley, Cal. This invention relates generally to improvements in joinery, and particularly in means for joining or splicing the sections of stair rails and the like. Its primary object has been to devise means of locking an ordinary round-headed carriage bolt against turning while the nut is being screwed on or, conversely, to anchor a nut against a round-headed bolt is being screwed into the nut. It consists of a washer having lateral projections or prongs and a central or polygonal perforation, said washer fitting over a bolt and adapted when the prongs are driven into the wood to prevent the bolt from turning. The nut may be embraced by a similar washer and be anchored in a similar manner.

ORE CAR.—No. 713,311. November 11, 1902. W. C. Matteson, Stockton, Cal., one-half assigned to D. C. Matteson, same place. The object of this invention is to provide a car of simple and economical construction that is easily dumped and righted in which the operation of dumping and the door is effected automatically. It consists of a novel form of dust-proof bearing and means for securing the wheels to the axle and to the frame, a centrally disposed rocking hinge support for the car body on which the latter is tilted to dump its load, a door pivotally hung at the top on one end of the car body, and a lever pivoted to a connecting sleeve embraced by the door hinge and secured independently of the hinge to the outside of the car body, and latch means by which the door is released or engaged automatically, according as the car is oscillated.

MINING AND SCIENTIFIC PRESS

Whole No. 2210.—VOLUME LXXXV.
Number 22.

SAN FRANCISCO, CAL., SATURDAY, NOVEMBER 29, 1902.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

A New Mining Building.

On the 18th inst., on the grounds of the University of California, at Berkeley, Cal., was laid the cornerstone of the new mining building to be used by the Mining College of the University. The building will cost when completed \$500,000. This is the gift of Mrs. Phoebe A. Hearst, and the building is to be a memorial of her late husband, Geo. Hearst, a California miner. It is the first of the structures for which Mrs. Hearst proposes to spend \$10,000,000, with the idea of having buildings of size and style commensurate with the character of the University of California.

The cornerstone was laid with all due ceremony. The California Miners' Association, which was in annual session in San Francisco, adjourned and participated in the event. Benjamin Ide Wheeler, the president of the University of California, delivered an address. Among other things he said: "Out of the seething ebb and flow of shifting public interest,

"The administrative department, with public and private offices for the dean, will open at the west of the memorial vestibule. On the east will be a lecture room and an office for the curator of the museum. At the north will rise marble stairways, in double flights, leading to right and left.

"The general mining laboratory will open on the central axis, opposite the main entrance. It will be virtually a great central court, 46x118 feet, open to the roof and lighted from above. A traveling crane will provide for the moving of heavy mining machinery. Broad galleries at the height of the first and second stories will serve as corridors and as vantage points for viewing operations.

"In the east wing there will be metallurgical laboratories for juniors and seniors, in the west wing research laboratories, and in the central northern portion of the building a dry-crushing tower, three stories high. The tower will be flanked by two rooms, 40x62 feet in size, one to be used as a smelting room for copper and lead and the other for a gold and sil-

to be true, have something of the rude, cyclopean. The emotion roused must be a sense of power rather than of grace. Even the scale of materials, the blocks of stone of which the walls are built, should be holder and more strongly masculine than that of any other structure likely to find a place in a great university. To produce a design for a mining building which shall in all sincerity express its purpose, and at the same time shall harmonize with future buildings quite as sincere in the expression of their purpose—purposes in almost every case of greater amenity—this has been the aim of the architect in approaching his task in its artistic phase. If in its treatment he shall have secured a true outward and visible expression of the inward and spiritual organism of the building, and if at the same time he shall have succeeded in throwing over it a degree of charm which shall make it seem a kind, bluff brother among a bevy of lovely sisters, he will feel that his efforts have not been wholly in vain."

"This, then, is the memorial we found to-day—het-

The New Building for the Mining College, University of California, Berkeley, Cal.

in the midst of the vain and transient cries of market place and forum, rise the solid walls, the stern, clean pillars of the university to vindicate in the name of that assembled and clarified knowledge we call science, that harmony of form we call art, and that digest of experience we call history, the steadiness and order of human life, and to proclaim that man liveth not by bread alone and that it is the things of mind and spirit which are eternal.

"The building which is to rise here will be dedicated to the use of the college of mining. It is to be built of the strongest and cleanest stone produced out of the California hills. When completed it will not only be the largest, but the most completely equipped building devoted exclusively to the study of mining engineering in the world. The plan of the building has been devised, after long and patient study, by the supervising architect of the university, John Galen Howard, who has worked in constant conference with Dr. Samuel Benedict Christy, the dean of the college of mining. Between them these two men have visited nearly every mining and technical school of rank in the old world and the new.

"The building will be adequate for all needs of the department for decades to come. It is so planned, however, that it can be indefinitely enlarged without sacrifice of symmetry or beauty. Moreover, the greatest elasticity will mark the interior plan. The framework is of steel, the floors are independent of the interior walls, and flues for furnaces, hoods, heating and ventilation are provided in large number.

ver mill. On the second floor, opening from the gallery of the memorial vestibule, will be two lecture rooms, one 40x42 feet, the other 24x42 feet, and private study and drafting room for the dean. On the third floor will be a library and stack room, and attic rooms for drafting, photographic work and other purposes. Adjoining each lecture room or laboratory will be a private study for the instructors.

"The aim has been to give expression to the character of a college of mining engineering," says Mr. Howard, "as distinguished from one of art, letters, or of natural science. The expression of helles lettres in architecture demands a more purely classic character than that of scientific studies. Such a building as a library, for instance, may without inconsistency rejoice in all the sumptuous glories of Roman architecture or the Renaissance. The tradition of the world leads one naturally enough in this direction. But the architect conceives that such delicate and highly organized motives find little place in a mining building, which demands a treatment, while no less beautiful, much more primitive—less elaborately developed in the matter of detail, less influenced by the extreme classic tradition either as a canon of proportion or as an architectonic scheme. The profession of mining has to do with the very body and bone of the earth. Its process is a ruthless assault upon the howels of the world, a contest with the crudest and most rudimentary forces. There is about it something essentially elementary, something primordial, and its expression in architecture must,

ter memorial and more lasting than the pyramid that Cheops reared; better, because it stands to help the life of men toward better things; more lasting, because it grafts itself upon the richest, warmest blood of the generations, and looks toward fruitage in the life of all the days to come. And the measure thereof no man can reckon. Here let it stand to tell of a virile character that struggled with nature and rude beginnings, and struggling won; but blended in the message must ever lie the reminder, though she wills it not, of a gentle woman whose thought went forth unceasingly toward others and others' good."

At the conclusion of President Wheeler's address the cornerstone was placed in position. As the cornerstone was lowered Mrs. Hearst said:

"The cornerstone is laid in honor of an earnest student of mineralogy, a practical miner—a man who measured men by their truth and methods by their honesty. It is our sincere hope that the department work of the Hearst Mining Building will add to the world's scientific and practical knowledge and that students may be here inspired to realize the highest ideals of labor."

Several articles were placed in an appropriate receptacle in the stone, among them a copy of the MINING AND SCIENTIFIC PRESS of the issue of Nov. 15, 1902.

The special photograph of the outer plan, as engraved and presented herewith, gives some idea of the appearance of this latest and newest American mining college when completed.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Published Every Saturday at 330 Market St., San Francisco, Cal.

TELEPHONE, DAVIS 771.

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada.....\$3 00
All Other Countries in the Postal Union.....5 00

Entered at the San Francisco Postoffice as second-class mail matter.

Personal; New Patents; Notices of Recent Patents; Commercial Paragraphs; Obituary, 319.

THE swiftness of mining progress in the West is exemplified in the case of Douglas, Ariz., a town of several thousand people, street railroad, etc., but not yet on the map.

A CHANGE from past custom is noted in the new policy adopted at the Massachusetts Institute of Technology, where it is intended that the head of each department shall be engaged in active professional work for commercial purposes, as well as being authority in his profession in the academic sense. It is experimental, but it is a move that must ultimately prevail in similar institutions, the general idea being that the best teacher can not be isolated from commercial activity.

THE inevitable discussion about capital trusts and labor trusts inevitably suggests the possibility of a trust in which capital and labor, employer and employee, combine to "cinch" the consumer. Whether it be lead or shoes, or coal or crackers, or zinc or putty, the rivalry of producers has tended to keep prices down, but should any industry organize a trust that embraced all the employers and employees in that particular industry the employers could pay any wage rate demanded and recoup themselves by passing the raise up to the consumer. The more skilled the industry the more liable this is to take place. The tendency is that way. When that does happen, then the consumers can organize a trust.

FREIGHT rates cut considerable figure in mining machinery sales in the various sections of the mining country, and many machinery manufacturers consider themselves cut off from certain territory because of existing railway tariffs. Chicago, Denver and San Francisco find that there is a constant tendency to decrease Eastern freight rates—west-bound rates are always lower than east-bound rates. On the Pacific coast prices on nearly everything are made by adding carload prices to freight rates. With Pacific coast ports, the ocean is a great factor in all freight arrangements; as to overland transportation San Francisco is at the rim of the wheel. With the ocean counted in, San Francisco, commercially considered, is about as near New York as Chicago is. Chicago has recognized facilities and advantages and Denver, by reason of its central situation and admirable railway system, also occupies a commanding position. Denver's great advantage lies in the fact that the railways recognized from the start the importance of the mining interests and threaded every canyon with connecting links of road, reaching throughout the entire State and connecting with all lines everywhere.

Taxation of Mines.

Now that elections are over newly chosen legislators who will represent the public next winter turn to thoughts of what to do, and what not to do. One thing that affects the mining industry everywhere is mine taxation. Many mining men annually feel a relief when their State or Territorial Legislature adjourns, because at least things are no worse.

There seems in some sections this year an intent to "go for" the miner in the way of new legislative enactments making even more onerous the present taxation. Probably the generally prosperous condition of the mining industry attracts attention and the idea is formed that anything doing so well ought to stand an extra "cinch." Idaho seems to have the idea that the gross output of the mines of that State should be taxed. That mining commonwealth also seems to think that a patented mining claim is fair subject for arbitrary assessment.

Colorado already has the system of output taxation, but seems to favor raising the rate and levying extensively on all mining machinery and improvements. Colorado has just sat down, hard, on the single tax idea, voting the Australian land tax proposition down on the 4th inst., but projects putting increased burden on the improvements.

Such restrictions and penalties violate the veriest A B C of wise government or just jurisprudence.

Montana seems to have a more fair system of mine taxation, a 3% tax on the net annual profits of mining. Nevada's former bullion tax, equivalent to a royalty on the gross value of the metal production, was productive of continual protest and friction. California's method is less open to objection. Arizona seems disposed to make mine development a penalty. Oregon and Washington cannot be said to have any system of mine taxation.

There is or should be recognition of basic difference between the taxation of mining property and almost any other kind of real or personal property—not to favor the miner, for the miner wants no favor—but justly recognizing existing facts. A man has \$100,000 worth of goods in his store; another has a \$100,000 machinery plant on his mine. It is manifest that the same general rule should not apply in both cases. It would be just as fair to tax a merchant or manufacturer on every dollar that passed through his hands in a year as to tax a mine owner on the mine's gross production.

A man has a \$50,000 farm, eternally reproductive; another has a \$50,000 mine, ephemerally so; the equities are dissimilar. Any system of taxation that tends to limit the number of workable mines is against public policy.

Freak assessments are occasionally noted, as in the case of the sapient Teller county, Colo., assessor who decided to assess on the valuation of what was represented by the mining stock quotations, the selling price of the stock to be the basis of taxation on the mine.

This thing provokes loss, litigation and delay and seriously affects the mining industry. It deters development, investment and general work. Take Cripple Creek district, Colorado! That is cited because it is to-day the most prosperous bit of gold-producing territory in the country, yielding \$2,000,000 in gold per month from a very small area. Yet the cinch taxation law of the last Colorado Legislature has had the effect of having Teller county report nearly 1500 mining properties in that district now for sale for delinquent taxes. The owners are willing to let their property go by default rather than submit to such extortion.

The present Colorado mine taxation law says in effect that a non-producing claim shall not be assessed more per acre "than is the lowest producing property in the same locality." Mining men are inclined in Colorado to naturally assume that that word "locality" means on the same hill, or in the same canyon, or, at least, in the same section of the camp, but the assessors seem disposed to interpret it as meaning only the next adjoining properties. So that as a result, even now, non-producers are in some instances assessed higher than are producing properties in what the owners claim is the same "locality."

Another question is the tax on unpatented mining claims. By a legal quibble regarding "possessory rights," the State presumes to tax United States property which is not taxable in or by any State.

The miner has no established title to the land, nor has the State. The United States Government does not grant to the locator any fee nor ownership on real or personal property. Yet the State assesses and taxes what the locator does not own nor the Federal Government grant. The only thing the locator really owns is the chance to make the property his own. Under this silly and baseless system an unpatented mining claim is "sold for delinquent taxes." But the State can give no title to property it does not own, nor can it work the property. All the State can do is technically deprive the prospector of his claim. All the prospector can do is to wait long enough, and when the ground becomes subject to legal relocation, locate it again. Then the State can assess him again, and when delinquent can "sell" the claim again, and after a while the prospector can relocate it again, and so on; a ridiculous proposition.

The matter is of importance to all miners. The intent of these fragmentary remarks is to suggest to newly-elected legislators, who propose introducing laws governing mine taxation in their respective commonwealths next winter, that a degree of caution is necessary and proper understanding of the subject absolutely requisite. The prospector should not be discouraged, the miner should not be frozen out, and the investor should not be unduly deterred from aiding development. The working miner is a good customer for everybody and a competitor of no one. He deserves a fair show and that's all he asks.

WITH the exception of a few frauds who have come to grief, this has been a prosperous year for the Eastern fakirs who prey upon popular ignorance and secure money from the credulous in exchange for worthless mining stocks. The general prosperity of the country and the prevalence of plenty of work at good wages have helped these fellows to swindle a good many out of money that the investors could poorly afford to lose. Some of the stories told are laughable. In Cincinnati, Ohio, one promoter who had an Idaho mining proposition of some merit was trying to sell some stock at 50 cents per share, but failed, as just ahead of him wherever he went had been an individual selling "mining shares" at 5 cents a share, and to the Cincinnati investor, to whom all shares look alike, it looked silly to pay 50 cents a share when he could get just as nicely printed shares for 5 cents. In Pittsburgh some enterprising mine "promoters" found their stock of slow sale, and concluded that they must own some mining property somewhere—it didn't make any difference where, but some showing must be made. Accordingly they bought a building lot on West Huerfano street, Colorado Springs, Colo., called it a "claim" and started again to sell stock, this time with considerable success, the money thus acquired "to be used for development purposes." A cellar was partially dug, and things went well till one Pittsburger happened to find out about the lot, and brought suit for recovery of the price of his "stock." The owners assert that they "refused \$50,000 for their claim." Doubtless that was so, as where there were two of them one could offer the other that amount and have it refused.

CRIPPLE CREEK, COLO., still reports as among the probabilities the merger of some of that district's big gold producers. It is asserted with some show of truth that Eastern men are financing the \$40,000,000 consolidation of the Portland, Gold Coin, Ajax, Mary McKinney and other producers, with the idea of effecting a saving of 20% in operation, dispensing with a number of men now employed in all capacities in and around the properties which it is proposed to "merge." Those who favor the plan say, however, that this is only "incidental," and that the main idea is to be able to meet and fight in any conflict that may arise in connection with other combines. The plan is possible, on the proposition that anything is possible, but it is extremely unlikely. E. J. Knight of Providence, R. I., who is chiefly mentioned in connection with the financial end of the alleged deal, is represented as saying that the matter is "sure to go through." It may—fall through. Economy is a good thing; so is fighting. But there are better things for Cripple Creek district than false economy or ill-timed factional quarrels. The deep drainage tunnel for that district is in the line of true economy, and is more worthy of encouragement than the combine scheme.

Concentrates

ALLOWING 20 cubic feet to the ton, one acre of ground 3 inches deep would contain 544 tons.

A BODY of galena in place one foot wide, 6 feet high, 6 feet long, would produce 16,582 pounds.

AT 100 feet piston speed a 10-inch duplex pump will deliver 800 gallons of water per minute.

LEAD at 4½ and silver at 49 is about the same as lead at 3½ and silver at 60 in the Idaho property.

FORTY-INCH pipe for hydraulic mining has been in use forty-five years. Forty-eight-inch pipe is not uncommon.

WITH an 850-pound stamp, the stem would weigh about 360 pounds; the head, 225; the tappet, 115; the shoe, 150.

A NINETY-POUND carboy of 50% acetic acid mixed with ninety pounds water will make 180 pounds 25% acid.

THE smooth surface of silver bricks is secured by burning sugar thereon while molten, briefly excluding the air.

GOOD steam coal will not contain more than 8% or 10% ash. It will take 10½ pounds air to burn one pound ordinary coal.

THEORETICALLY, the velocity of water per minute through a 9-inch pipe, 6000 feet long, 600 feet head, would be 785.4 feet.

GALENA and native copper are found in the gold quartz mined at the Apollo mine, Shumagin Islands, Unga, near Delarof, Alaska.

ANY assay melt that has carbon in the charge shows a tendency to puff, and the crucible two-thirds full will give more satisfactory result.

THE first electric light plant installed on shipboard in United States waters was on the steamship Columbia of the O. R. & N. Co., at San Francisco, in 1880.

A SINGLE-LACED BELT, 1 inch wide, will transmit 1 H. P. when traveling at a speed of 789 feet per minute; in the case of a double belt, 550 feet per minute.

THE Garrettson furnace was illustrated and described in the issue of January 21, 1899. Its recent use at the Crofton, B. C., smelter is not reported a success.

"THE present ratio of silver to gold" can be found as always by dividing the price of one ounce gold, \$20.67, by the present price of one ounce silver—49 cents—about 42 to 1.

CONTINUOUSLY, a miner's inch in twenty-four hours will discharge 2160 cubic feet of water. A flow of one cubic foot of water per second equals 50 inches under 4-inch pressure.

STEPHANITE (black silver) carries: Silver, 70.4%; antimony, 14%; sulphur, 15.6%. Silver glance is 87.04% silver and 12.96% sulphur. Chloride of silver (horn silver) fuses at 500° F.

A DOKIMASTIC TEST is understood to mean a metallic assay that is conducted under such circumstances and with such appliances and surroundings as to insure absolute accuracy in the announced result.

THE running time between San Francisco and New York City is 100 hours. The 985 miles between New York and Chicago is made in twenty hours. Steep grades necessitate slower time west of the Mississippi.

THE mere posting and recording of a claim to water confers no right upon the appropriator unless within sixty days after the notice is posted, construction of works is begun, "and diligently prosecuted to completion."

LOCAL conditions govern the use of water in a stamp mill: nine gallons per battery of five stamps per minute, and two and one-half gallons on the accompanying two concentrators per minute might be considered average requirement.

BY "free air" is meant air at one atmospheric pressure, 14.7 pounds to the square inch. An altitude of 6000 feet—barometer 23.83—would give an air compressor—theoretical standard 100% sea level—a comparative efficiency of 82.8%.

IF a volume of air at 60 pounds pressure, equivalent to 18,000 cubic feet per hour, at atmospheric pressure be passed through 1000 feet of pipes, the loss of pressure of air for 2½-inch, 3-inch, 3½-inch pipes would be 5½ pounds, 2 pounds, 1½ pounds, respectively.

TIN will amalgamate as readily as copper or silver. Before using perforated "tin" screens, the tin coating should first be burned off; otherwise the formation of tin amalgam would clog the discharge. On clean ore such a screen will last about thirty days.

THE theoretical horse power of a stream of water may be determined by multiplying the head or fall by the decimal 0.1136; this gives the value in horse power for one cubic foot per second; multiplying this result by the available number of cubic feet per second.

WITH moderately warm water mercury becomes more liquid, and in the clean-up amalgam from very fluid mercury has been found to retort higher. Amalgam that retorts up to one-third will sometimes change during the winter months under adverse circumstances to one-fifth.

REQUESTS for publications of the California State Mining Bureau should be sent to L. E. Aubury, Ferry Building, San Francisco, Cal. Similar requests regard-

ing Colorado should go to H. A. Lee, Capitol Building, Denver, Colo.; Montana, John Byrne, Helena, Montana, and Idaho, Robt. Boll, Blackfoot, Idaho.

THERE is no such thing as "non-assessable stock" under the laws of California. The stock in a corporation of any kind in that State is subject to assessments, and stockholders are responsible for the amount of assessments legally levied upon corporate stock held by them, any agreement to the contrary notwithstanding.

THE supreme court of the United States, in the case of Chambers et al. vs. Harrington (III U. S. 310), held "that when adjoining claims to mineral lands are held in common work for the benefit of all done upon one of them in a given year to the amount required to be done upon all in that year meets the requirements of section 2324, United States Revised Statutes."

TO DETERMINE the amount of air that can be produced by different size air cylinders, multiply the area of the cylinder by the stroke; multiply result by 2 if it is a straight line compressor; by 4 if a duplex compressor; or by 2 if a compound duplex compressor. Divide this result by 1728, which will give the amount of air per stroke, then multiply by number of strokes per minute.

WHERE there is a known quartz lode or vein included in a placer claim, an application for a patent thereto must state plainly that the placer contains such vein or lode; also must any notice published in a newspaper or posted. It must also be surveyed and marked upon the filed plat of the claim, and the field notes and plat must separately give the area of the lode and the area of the placer.

THERE is no authority of law for changing the courses of a patented claim, and surveys adjoining or intersecting such lines must be made to conform thereto. The land department is without jurisdiction or authority to correct any mistakes that may have been made in the surveys, as long as the patents remain outstanding. Nor can patent be lawfully issued for lands already patented to other persons.

NITRO-GLYCERINE is composed, chemically, of oxygen, 60.66; nitrogen, 19.91; carbon, 17.06; hydrogen, 2.36. It can be made by slowly dropping syrup of glycerine into equal volumes of nitric and sulphuric acid, mixed, and surrounded by ice, the stuff being strongly stirred after each admixture of the glycerine, but there are more preferable forms of suicide than any amateur attempt to make the stuff.

IN the Lake Superior copper mines the Calumet and Hecla ore carries 3% copper; Quincy, 1.5%; Tamarack, 1.3%; Osceola, 1%; Wolverine, 1.1%; Atlantic but a little more than one-half of one per cent. In Montana the Anaconda carries about 4½%; in Arizona the Copper Queen carries 8%; the United Verde 7%. In California the Mountain Co. carries 8%; the Boleo Co. of Mexico, 6%; the Rio Tinto in Spain, 3%.

IT has been repeatedly asserted that chloride of gold has been discovered in a natural state, but so far as "Concentrates" knows the assertion has not been fully substantiated. The nucleus of a nugget has been repeatedly produced from deposition of chloride of gold on iron pyrites. Where the solution of gold chloride is 4 grains to the ounce of water, the pyrites or other base begin to decompose, the iron sulphide changing to yellow oxide.

AMONG the causes of low efficiency in air compressors are the heating of the air during compression, mechanical defects in the inlet and outlet valves, and leakage past the piston. Inlet, when subjected to compression, is heated, and as the volume is thereby increased, much power is uselessly expended in dealing with the heated air. The most efficient compressor, therefore, in this regard, must be the one presenting the best cooling arrangement for the air as it is being compressed.

A CHEAP and reliable preparation for detecting counterfeit coins is: Test for gold—Strong nitric acid, 6½ drachms; muriatic acid, ¼ drachm, or 15 drops; water, 5 drachms. Test for silver—Twenty-four grains nitrate of silver, 30 drops nitric acid, 1 ounce water. Use the liquid as near the edge of the suspected coin as possible, as that is the part most worn. A drop of the preparation will have no effect on genuine coin, while it can be plainly seen on the counterfeit. Heavily plated coins should be scraped slightly before using.

EXPERIMENTS show that in a 2-inch steam pipe, 100 feet long and under eighty pounds pressure, the condensation amounts to 60.3 pounds of steam per hour when the pipe is bare and to 16.14 pounds per hour when covered. With steam at 100 pounds pressure, the condensation, when uncovered, reaches 72.20 pounds per hour. In a 10-inch pipe 35 feet long, carrying steam at 100 pounds pressure, the condensation, when uncovered, amounts to 112 pounds per hour, and when covered to but 15.93 pounds per hour. The temperature of the surrounding air ranged during the experiments from 50° to 75° F.

IN the ordinary construction of wire ropes the wires forming the strands are twisted to the left hand, but the strands are twisted to right hand, or opposite direction. In the "Lang lay" the wires forming the strands and the strands comprising the rope are all laid in the same direction. The average elongation of ordinarily constructed rope is about 3%, and with Lang lay 1½% to 2%. With holisting ropes the life can be increased by ordering

sufficient length to enable about 6 inches to be cut off the end occasionally, thus changing the point of lift or stress. A rope should be greased frequently and carefully with a good quality of lubricant, free from acids.

AT the plant of the Electrical Lead Reduction Co., at Niagara Falls, spongy lead is produced from galena. The galena is powdered and placed in lead. The pans are so arranged in nests that the bottom of each pan and the galena within act as a cathode and the under side of the pan placed above it acts as an anode. The electrolyte is dilute sulphuric acid. The hydrogen liberated at the cathode reacts with the galena as follows: $PbS + H_2 = H_2S + Pb$. The hydrogen sulphide and the oxygen set free at the anode are conducted away and converted into sulphuric acid. The spongy lead which results from the reduction is either pressed into plates for storage batteries or roasted to form litharge.

AS TO brushing battery plates it has been argued that final brushing be crosswise, i.e., at right angles with the course of the water, as it flows down the plates. Still, if say half of a set of plates be so brushed crosswise, and the other half lengthwise (parallel) with the running stream, if the battery stops running, the water continuing down the plates till clear, it will be often observed that the surface brushed parallel with the flowing stream is clean and well adapted to the adhesion of particles of gold passing out through the screen, while the portion brushed crosswise will appear dirty and discolored, the furrows being filled with minute particles of iron and sulphurets coming from the battery, only the summits of the little ridges being presented for the adhesion of the gold.

THE ownership of a mining claim of individual interests by two people does not make them partners. They are co-owners. Partnership is a matter of agreement. Co-owners, by an agreement, can form a mining partnership. If A, as a co-owner, bonds his half interest in a mining claim without consideration that is entirely his affair. The action of A does not bind B, who owns the other undivided half interest. If B bonds his half interest for a consideration, irrespective of the nature of the consideration, whether money or its equivalent in assessment work, the whole of it belongs to B, and he is not compelled to divide it with A. If the consideration was fifteen days' work, estimated to be half the amount required, it all inures to B's benefit, and A must perform the other half. The other half must be performed, too, otherwise the location becomes forfeit.

LANDS valuable for mineral are reserved from sale, except as otherwise expressly directed by law; and whether any certain lands are mineral or agricultural in character is a question of fact to be determined by proofs. While the right to a patent is equivalent to a patent issued, yet the purchase of lands containing minerals, under laws governing the sale of agricultural lands, does not vest any right, whatever, in the purchaser, for mineral lands are reserved from sale; and if no right to a patent exists, a patent cannot legally issue. No title from the United States to land known at the time of sale to be valuable for its minerals of gold, silver, cinnabar, or copper, can be obtained under the pre-emption or homestead laws or the townsites laws, or in any other way than prescribed by the laws especially authorizing the sale of such lands. Title to known mines does not pass with a patent issued under the laws regulating the disposal of agricultural lands. Land more valuable for its deposit of limestone than for agricultural is mineral land subject to sale under the mineral laws.

THE object sought in adapting briquetting to the smelting of fine ores is to obviate the loss ensuing from the escape of fine-dusts, concentrates, and granulated mineral fines during the smelting process, and to put the fine mineral ores, tallings, and similar fine materials into such a form as will admit of their being treated in the smelter without the loss which has heretofore resulted. Before briquetting was taken up as the logical solution of this problem by smelter-managers, considerable had been expended in experiments along many lines; but now many smelting concerns are operating briquetting plants for the treatment of fine dusts, and in many instances materials which for years have been running down the canyons or into settling basins are being carried back to the smelters, and after being solidified in the form of mineral briquettes are being resmelted with considerable profit. Through the treatment of these mineral fines, and of fine-dusts, and slimes from the concentrators, it has been found possible to increase the smelter output 10%, old ore-dumps and fine-dust containing as low as 3% to 6% of mineral value being treated by the briquetting process with much profit. In addition to these advantages, the briquetting industry as applied to fine minerals eliminates numerous disadvantages arising from the use in the smelter of concentrates and fine ores in their natural state. Aside from the establishment of many briquetting plants at the smelters, many mine-owners are erecting briquetting plants at their mines. The blast used in the smelter, while not nearly as strong as that used in a blast furnace for the reduction of iron ores, is still strong enough to force out a large quantity of fine ore in the form of fine-dust. In order to catch this fine-dust the gases and fumes from the top of the smelter are forced through long underground tunnels before they are finally emitted from the stack, and in this tunnel a considerable percentage of the dust is deposited. At intervals the tunnel is cleaned, and this deposit, after being treated by the briquetting process, is again sent to the smelter.

Electric Power for General Purposes in Mining and Milling.*

This paper deals with results obtained in Amador county, Cal., using electricity at \$6.50 per horse power per month, furnished by the Standard Electric Co. of California, generated at their plant at Electra, Amador county, from which about 14,000 H. P., of alternating current, is distributed through the central portion of the State. The transmission line along the mother lode from Angels Camp, Calaveras county, to the Fremont mine, $1\frac{1}{2}$ mile north of Amador City, carries a 10,000 volt current, which is transferred at each mine to 550 or 600 volts for power purposes and 125 volts for lighting purposes. At the Fremont mine the superintendent, C. E. Purington, has installed a 20 $\frac{1}{2}$ x24 duplex Ingersoll single stage compressor, capacity 1700 cubic feet free air per minute. The compressor is operated by a 300 H. P. general electric motor. The air is used for all purposes, hoisting, drilling and pumping water. The plant is only recently installed, so figures cannot be given accurately, but the superintendent informs me it is giving entire satisfaction. This plant is equipped with six air receivers of 1500 cubic feet capacity and several hundred feet 6-inch pipe for storage, besides the three steam boilers in which the air used (by hoisting engine) is reheated. This compressor has a unique unloader, being an automatically regulated valve in the pipe through which the compressor takes air, which valve is closed when the air pressure reaches any particular point it is set at. Of course, if the compressor sucks no air it pumps none, or practically so.

The Keystone Co. at Amador City saved \$150 per month using electricity at \$6.50 per horse power month, compared with water used under 185 feet fall at 20 cents per inch, formerly used in running this 40-stamp mill. They are now using compressed air for hoisting and drilling, the compressor being run by a 300 H. P. general electric motor with a 550 volt current. This plant is only recently installed. At the Kennedy mine a change from pine wood at \$6 per cord in the furnace to crude oil at \$1.50 per barrel was made. They found that \$17 worth of oil did the same work as \$24 worth of wood.

The article deals largely in compressed air plants, for with the exceptions when electricity is applied direct to mill rock breaker, blowers and pumps, compressed air, apparently, is the only resort, which accounts for its prominence in this paper, and as most mines are equipped with steam engines it is very easy to change from steam to air, as well as making it possible to fall back on steam in emergencies. As to electricity applied directly: Through the kindness of C. R. Downs, superintendent, and J. F. Phipps, assistant superintendent of the Bunker Hill mine at Amador City, Cal., I am informed that it costs them just one-half as much to run a No. 10 Buffalo forge blower by electric motor as by an upright steam engine, and much less care and repairs. The blower runs 1700 revolutions per minute, blowing 4000 cubic feet of air per minute through 2000 feet of 11-inch pipe at a cost for power of \$1.06 per day. This blower is run by a 10 H. P. general electric induction motor, consuming 5 H. P. per day; using steam it costs \$2.12 per day. Here they also have a 12x14 Ingersoll single stage compressor running 160 revolutions per minute belted direct to a 50 H. P. general electric motor, using air for drilling and pumping. Until recently all the pumping was done by steam at 100 pounds pressure, and I am informed that they see no difference in cost of pumping by air or steam; it is about equal, with the advantage of having the air to use for drilling when needed. However, I believe from my experience at the South Spring Hill that if the steam cylinder end of the pumps were large enough diameter to use at forty pounds pressure and keep up to speed, there would be a balance in favor of air against steam. They are paying \$6.50 per horse power month for electricity and \$6 for first-class pine wood in the furnace. This was proven very satisfactorily at the South Spring Hill where the pump running by compressed air was especially designed to work on air at forty-five pounds pressure, raising the water 725 feet vertically in one lift, the back pressure of the water at the pump being about 345 pounds to the square inch. This pump worked cheaper on air than it would by steam. Leakage and extraordinary heating of the air from compression make it advisable to use low pressure air whenever possible.

At the Oneida mine electricity is applied direct, a general electric 100 H. P. motor being geared directly to a Dow duplex plunger pump. This pump raises 200 gallons of water per minute, about 19 miners' inches of water, 1300 feet vertically in one lift through a 6-inch pipe for four and one-half hours daily at a cost of \$3.40 per day for power; at \$6.50 per horse power month 100 H. P. of electricity is used; the actual weight of water raised 1300 feet represents 65 H. P., so that there is a loss of only 35 H. P., or 35% in radiation on line from the transformer to the motor in the mine, friction in motor,

pump and pipe line, giving an absolute efficiency of 65%, which compared with steam or air is about three or four times as efficient, taking into consideration the amount of energy purchased.

W. R. Thomas of the Central Eureka informs me that it costs about one-half to run their blower by electricity as it formerly did by water at 20 cents per inch. When the water head is 500 feet or so I believe it to be about a standoff with electricity at \$6.50 per horse power month and water at 20 cents per inch for power purchased, with the advantage in favor of electricity by eliminating long and expensive ditch and pipe lines, with their constant repair, maintenance and delays due to breakage.

It is not necessary to cite other mines using electricity direct regarding its efficiency, and I desire to devote the remainder of this paper to the use of electricity for hoisting purposes, through the medium of compressed air. However, it seems very strange that a proper understanding cannot be had as to the feasibility of electricity applied direct to hoisting machinery.

The first essential to every compressed air plant is ample storage, so that a minimum size compressor can be used, running comparatively slow, and maintain the working pressure as nearly constant as possible. Air once stored can be used to-day or next week if properly stored. As to leakage, let me call your attention to this fact: At sixty pounds pressure air will travel through a pin hole at the rate of 600 feet per second, or 36,000 feet per minute, nearly 7 miles per minute, so however small the hole is the volume is large where a steady stream is blowing away. The same rule applies to the blowoff, so use an unloader of some description, preferably one that holds the outlet valves open, allowing the compressor to be in absolute equilibrium, forcing air into the receiver from one side of the piston and drawing it from the receiver on the other, and vice versa on the return stroke.

As to two or more stage compression I desire to call your attention. It is the ideal way to compress air, but so-called two-stage compressors are a farce, unless the intercooler is of sufficient size and proper design to return the air to something near the atmospheric temperature while it is passing from the low to high pressure cylinders. The term two-stage is used a great deal to sell inefficient compressors.

It takes power to run a compressor 60, 75 or 150 revolutions per minute even if it is unloaded, so plan the size of compressor and storage so that it runs unloaded as seldom as possible only in emergencies of idleness for comparatively long periods of the machinery using air. It is no more necessary to have the compressor running unloaded most of the time than it is to have steam blowing off continually because there is a blowoff valve on the boiler. With an induction motor and the alternating type of current used in this county it is not possible to start and stop the compressor to avoid blowing away air, so that must be accomplished by proper storage, unloaders, and more important than anything else, a proper size compressor, neither too large nor too small, so that the aggregate amount of air used in twenty-four hours will be furnished by the compressor running at a speed not to exceed 200 feet of piston speed per minute with the stroke at least double the diameter of the cylinder, for economical results. Heavy flywheels are more essential on a compressor than on a rock breaker, although generally not so considered, to prevent any jerking on the rope transmission or belt. In a 10-inch diameter compressor, at the end of each stroke the pressure changes when pumping against 100 pounds pressure from a hold back of 7854 pounds to a shove ahead of the same amount, and the air left there due to clearance runs the motor for an instant. A total change in tension on the belt or rope of 15,708 pounds, or nearly eight tons, a heavy fly is required to steady this motion, or it will jerk the life out of the belt or rope in a short time, as well as cause slipping. Avoid countershafts by a large diameter heavy rim flywheel on the compressor and avoid a tightener on belt driven compressors which takes power to run it 800 or 1000 revolutions per minute, by placing the motor far enough from the compressor, using a wide belt, so that the weight of the belt, with the slack side on top, will be sufficient to prevent slipping, which is another item of loss.

Now as to the efficiency of compressed air for hoisting engines, how can one expect air to be thoroughly satisfactory when the largest portion of power goes up the exhaust pipe, as well now and then it is all escaping through the blowoff on the receiver. I mention this because I have seen several plants doing this very thing and those in charge complaining about their compressor, or the electric motor, or some other reason, whereas the compressor is all right and a good, willing friend, likewise the electric motor, but the type of hoist and the storage and other things arranged by the superintendent himself are the only faulty things about the plant. Electricity and compressed air are a comparatively recent factor with which all miners must sooner or later familiarize themselves with, and when they meet this new factor with intelligence it will be as simple as hand drilling now is to the average miner. What would a superintendent say to his engineer if he continually had steam blowing off, or what would the board of directors say if there was a continual

stream of water running over the waste gate of the reservoir? Yet just such extravagance has been and in some cases is being practiced with compressed air. Treat it as economically and intelligently as you would water power, wood, fuel oil, and with the electric current at not over \$6.50 per horse power month it will be your best friend.

Receivers should be close to the compressors, and if possible, where the air is used for general purposes, run the air through an old boiler, submerged in water, which will compel the air, by cooling it, to drop what water is in it immediately and not drop it in the pipe line going down the shaft, so that it will not scour the pump cylinders and machine cylinders, as well as to a great degree prevent freezing at the exhaust, a common inconvenience. An old crosscut underground bulkheaded with concrete makes an efficient and at the same time large and cheap storage. Large piping and the absence of 90° elbows are very essential for economy. So much for the air plant; now for the hoisting engine itself.

Use double compound tandem engines; in other words, take an ordinary double cylinder hoist and add a low pressure of about twice the piston area of the present one, extend the piston rod through the rear head of old cylinder into the low pressure, and with the cut off added to the low pressure you have a double compound tandem hoisting engine. This allows starting the load with the two high pressure cylinders, instead of having to rely on the high pressure alone as in a duplex compound, with a high pressure on one side and a low on the other. Air does not condense like steam, so that the power in it is utilizable till it has expanded to nearly atmospheric pressure.

As to reheating air the cost is only trivial, for every twenty-four pounds of good coal or its equivalent in wood in reheating air at about eighty pounds gauge pressure an additional horse power for twenty-four hours can be obtained. Whereas, under good conditions, it requires from 96 to 120 pounds of good coal to get one horse power for twenty-four hours from steam, with first-class boilers modernly installed and operated. Using the steam boilers for reheating the air makes it possible to revert to steam in a few minutes at any time, in case of emergency, without loss of time.

In the MINING AND SCIENTIFIC PRESS of April 26th, this year, is a description of the plant at the South Spring Hill mine at Amador City, the planning and installation of which I had in charge. The compressor used is 10x18 duplex single stage poppet valve type, driven by a 30 H. P. general electric induction motor, and formerly run by water power. In this case the blowoff by use of an automatic valve arrangement at the air receiver was led into the steam boiler, so that unless the hoisting engine was idle there was no air wasted; however, considerable air was in this case allowed to blow away on account of the compressor not being equipped with an unloader. When the pumps and drills were not in operation all the air went to the steam boiler, there being reheated and used by the engine. The largest amount of wood used for reheating purposes was one-half cord per twenty-four hours. Under these conditions the cost of the power to operate the hoisting engines was reduced to one-half, a larger economy than has been made by oil, due mostly to the fact that forty-five pounds gauge pressure would haul the load, which means low pressure air. The compressor ran fifty-nine revolutions per minute, and furnished enough air to run two drills (3 $\frac{1}{2}$ x3 $\frac{1}{4}$ Rand), breaking sixty tons of very hard ore per day, hoist the same 550 feet, and about eighty tons of water per day with the use of one-half cord of wood. The average consumption of electricity was about 20 to 25 H. P. per day, the bills varying from \$135 to \$160 per month, and were more than covered by the wood saved as compared with running the hoist entirely on steam.

In milling not much needs to be said, as there electricity is applied direct. Electric motors put at least 90% of the power purchased into the belt, which, of course, discounts water or steam at prevailing prices. It is easily and cheaply installed, is a clean power, should not fluctuate, has a permanent speed regardless of hot boxes or bearings, either one stamp or all of them, can be hung up without an appreciable change in speed of the cam shaft. Concentrators can be started at will without varying the speed of others, giving a proper separation at all times, so that to the maximum extent possible, in a mechanical separation there is no sand in the concentrates nor any sulphurets in the tailings. Electricity is the miners' friend, and I trust that in the future, as well as now, those estimable gentlemen who are putting their brains, as well as capital, into these large electricity generating plants, will be working side by side with the miner, for the miner will always be their nearest consumer, and as one prospers so will the other. Mines and mills need no longer be far apart, thanks to our so-called electrical friends, and the advent of electricity, which travels with equal facility up hill as well as down, in sunshine or storm, unlike water, or teams, or railroads, and lays down at our very door, continually without interruption, ready harnessed for work, the greatest and most efficient power the world has ever seen, so that the miners can mine and mill on the highest mountain top as easily as in the valley, providing climatic conditions or the topography of the country do not pre-

clude it altogether. As to electricity direct for hoisting purposes, it should be taken up and fathomed, for its successful application is a very important economic proposition.

I desire to thank the various superintendents along the lode in Amador county for courtesies extended and data freely granted.

Use of Crude Oil in Smelting.*

Through your secretary, Mr. E. Benjamin, I received a request to prepare a short paper "On the Use of Crude Oil in Smelting." This I have endeavored to do, confining myself entirely to the practical side of the subject, and leaving the discussion of heat units, chemical composition of liquid fuels, combustion gases, etc., to our more scientific friends—the professors of the universities and technical schools.

Fuel oil for the generation of steam is not my subject, and you all are no doubt familiar with this problem. However, let me state to you, that at the Selby Smelting & Lead Co.'s Works, we use liquid fuel exclusively for the generation of steam—in Stirling water tube boilers, rated at 250 and 290 H. P., respectively. We burn an oil of from 26° to 27° gravity, and evaporate, per pound of oil, fourteen and a half to fifteen pounds of water, from and at 212°. This gives you a basis to figure the comparative value of oil with coal as a steam generator. Another way of getting at the comparative values of liquid fuel and coal is the following: In a large matting furnace of the reverberatory type, it is considered that one ton of coal should smelt about three and one-half tons of ore. I find that in the same matting furnace at Selby, I can smelt one ton of ore with one harrel of oil; this would give us three and one-half harrels of oil to three and one-half tons of ore; or, in other words, three and one-half harrels of oil are equal to one ton of coal. One ton of good coal is worth to-day in San Francisco, we will say, \$6. This means that one harrel of oil at \$1.71, or three and one-half harrels at \$6, would be equal in effective value to one ton of coal at \$6; and you all know that good fuel oil can be bought to-day in San Francisco for one-half of \$1.71 per harrel, and even less. In other words, you can save 50% and more by the use of liquid fuel instead of coal under the prevailing conditions and prices for coal and oil.

I wish to mention right now that I am not interested in any oil wells or oil stock, and am not attempting to hoorn liquid fuel.

The following metallurgical furnaces use crude oil at our works at Selby: Four roasting furnaces, with a total of eleven burners; one matting furnace, with three burners; one copper furnace, with one burner; fourteen lead furnaces, with fourteen burners; thirteen zinc retorts, with thirteen burners; three cupel furnaces, with three burners; one antimony furnace, with one burner; one furnace for melting fine silver, with one burner; total, 47.

In all of these furnaces the use of crude oil has brought about a saving of from 40% to 60% in the cost of fuel over coal. And this does not represent all the benefit to be derived from the use of liquid fuel in metallurgical establishments.

Let me quote you a few simple chemical reactions that you all are more or less familiar with, and which are of vital importance to all metallurgical institutions.

In the process of oxidizing sulphide ores, commonly called roasting, or desulphurizing, it is necessary that the atmosphere in the roasting furnace should contain as much free oxygen as possible to enable the sulphur in the raw material to oxidize or burn off in the shape of sulphur di-oxide (SO₂), and sulphur tri-oxide (SO₃). In using coal as fuel it is impossible to maintain this oxidizing atmosphere all the time, because, every time that fresh fuel is fed to the fire box, black gases can be seen to fill the interior of the furnace, and during this period of incomplete combustion, the process of roasting, or oxidizing, is absolutely at a standstill. What happens? A certain amount of fuel and time are wasted and nothing is accomplished.

Now look at the ideal conditions prevailing in the roasting furnace when liquid fuel is used. Once the flame is regulated, by properly adjusting the oil and steam inlets, we have a clear flame, with not a trace of soot in the roasting chamber; and this ideal condition continues for twenty-four hours per day, enabling the sulphur in the ores to combine with the oxygen in the air during every fraction of a second. This means that we can crowd a roasting furnace using oil far beyond the capacity of a furnace using coal, and still we can produce a good end roast with the same per cent of sulphur remaining. This means that we reduce the cost of fuel, labor and repairs per ton of ore treated. In all metallurgical furnaces where the aim is to oxidize, these same benefits are to be derived from the use of liquid fuel. I quote you, for instance, the cupel furnace, where the lead is oxidized to litharge, leaving the silver and gold on the hearth, or test, as dore silver.

But let me mention the matting furnace, of the re-

verberatory type. In this furnace the roasted ore is subjected to a white heat to produce a quick sintering and melting down of the charge. The aim in this furnace is to produce, first, "a copper-iron matte, which acts as an accumulator for the precious metals;" and secondly, "a slag which is formed from the earthy components of the ore." As matte is a compound of sulphur and heavy metals (mainly copper sulphide and iron sulphide) in fixed proportions, it is self-evident that the per cent of copper in the matte depends on the amount of sulphur remaining in the charge.

Suppose now that we use coal as fuel in the matting furnace, we will have a reducing atmosphere whenever the fireman gets busy and fills the grate with fresh fuel, thus producing an incomplete combustion for a certain length of time. During this period no sulphur can be oxidized by the oxygen of the air. With oil we have an oxidizing atmosphere during every second and consequently we find that we produce a higher grade copper matte in a furnace using liquid fuel than we can possibly produce in a furnace using coal. On the other hand, if it should be desirable to have a reducing atmosphere in metallurgical work, it is easy to change from an oxidizing atmosphere to a reducing one in an instant, by either choking the air inlet to the furnace, or increasing the flow of oil to the burner. This leads to the oil burner proper.

There have probably been 2000 patents granted for oil burners, each claiming remarkable and even most surprising results. For instance, some inventors claim that their burners will generate hydrogen. When asked to explain this, and how they expect to benefit the kind people by this most remarkable reaction, the usual answer is, "the heat decomposes the steam into oxygen and hydrogen; and there you are." In their eagerness to praise their burners they forget that plus and minus balance fairly well in nature, and that it would take exactly the same amount of heat to dissociate water into its component parts, namely, hydrogen and oxygen, as would be generated by combining or burning the oxygen and hydrogen so generated, minus a liberal amount of heat wasted by radiation.

When deciding to use liquid fuel, it is necessary to decide whether steam or compressed air shall be used as an atomizer. Let me call your attention to the fact that the use of compressed air necessitates a compressor, and an apparatus for preheating the compressed air. This latter appendix is very much to be recommended, because as you know, in allowing compressed air to expand the temperature of the surrounding air will be lowered. A cold or nearly freezing temperature will not be beneficial in atomizing liquid fuel preparatory to obtaining complete combustion. Steam, on the other hand, carries a certain amount of heat to the oil, and liquefies and even gasifies the same. Of course, all this pertains to plants on terra firma. On board a steamer it is different, where water has to be carried along, or sea water is to be distilled, in which case I should prefer to use air under pressure.

As the dimensions of metallurgical furnaces are variable ones, you will readily understand that we need flames of many different sizes for our metallurgical tools. For instance, at Selby, the extreme lengths of flames used are 8 inches and 6 feet. In the zinc retorts, which are our smallest furnaces, we need a flame of 8 inches. In the large matting furnace, 35x16 feet in the clear, we need a flame 6 feet or even more in length. The burner has to be adapted to the furnace and to the work to be performed. Hence you will find at metallurgical establishments a great variety of burners, or at least a great variety of sizes of burners, and I know of no better all-around burner than the one made of two concentric pipes, the smaller one being the oil pipe, and the larger one the steam carrier. By this arrangement the oil pipe is steam jacketed, and the temperature of the oil is raised to such a degree that its fluidity is very much increased, and part of the lighter oils become gases. All this tends to break up more or less the viscous oils into minute particles, which ignite readily when brought in contact with the oxygen of the surrounding atmosphere.

The following advice to future users of oil as fuel may not be amiss in concluding this paper:

First. By all means engage an expert to install your plant, and do not experiment yourselves, as it costs money to do so.

Second. Do not use a mixture of different gravity oils.

Third. Do not use a mixture of heavy residues with light oils from the oil refineries, as this mixture will not remain mixed. Oil refineries are very fond of mixing heavy residues with some light oils, thus producing an oil of the gravity corresponding to the one contracted for.

When making a contract for liquid fuel, insist that nowhere in the contract shall appear the words "fuel oil," but call for crude petroleum of a certain gravity, and insist, if possible, on getting the crude petroleum from wells producing very near the same gravity of oil. Suppose you contract for "fuel oil" of, say, 20° gravity; (and not for "crude petroleum") it is possible, and also probable, that you will receive a fuel oil of 20° gravity, but you will not always receive crude petroleum at 20° gravity. The refiner has a perfect right by this contract for "fuel oil"

and not "crude petroleum" to send you a mixture of residuum of, say, 10° gravity and a distillate of crude oil of 35° gravity in such proportions that the mixture will show 20° gravity. This mixture will be pumped into your storage tanks, and in a very short time you will find lumps as big as 10 inches to 12 inches in diameter; and on top you will find the light oil, or distillate. These lumps, which the refiners term B. S. (I refer you to them for an explanation of this, to me an entirely new and unknown chemical formula), will enter your pipes and burners, and will stop your oil's system up very effectively. Another point that should be observed in making contracts for crude petroleum is the percentage of moisture and grit allowed in the oil. Two per cent is a liberal allowance to be made to the seller, and if the crude oil contains more than 2% water and dirt, a proportionate deduction should be made from the oil received.

A very simple test for the determination of the grit and water in the crude oil is the following: Place in a graduated tube .01 cubic centimeter of the oil to be tested; add to this .01 cubic centimeter of gasoline; shake this mixture well and let it remain in a fairly warm place for twenty-four hours. By counting the cubic centimeters that represent the water and grit, which are easy to be distinguished from the oil, you have the percentage without any figuring.

During the last few years I have been repeatedly approached by parties asking me why I do not use oil in the blast furnace, and the only answer I can give them is the following: Solid carbon plays a very important role, especially in the upper level of the blast furnace shaft. Its function, especially with the fine ores, is largely to liner up the charge and allow the flow of gases to penetrate the charge evenly; besides, incandescent carbon has certain functions to perform in the blast furnace, which are of a chemical nature, and which need not be discussed in this paper. If coke or charcoal should be entirely replaced by oil in the blast furnace, the blast furnace charge would very likely become too dense to allow the combustion gases to escape freely. Besides, it seems to me, there would be considerable danger from explosions, if oil should be used as a fuel in blast furnaces. However, I think it may be possible to replace part of the solid carbon fuel with liquid fuel, but am not prepared to state at this time what percentage of liquid fuel could be used, or what mechanical arrangements should be introduced for the use of liquid fuel in the blast furnaces.

An Old Mining Property.

Probably the oldest mining property west of the Mississippi river is the Mine La Motte, which comprises several thousand acres in Madison and St. Francois counties, Mo. It was a French grant made in 1717, title to which was confirmed by Act of Congress to its then owners in 1829. The mine took its name from M. de la Motte Cadillac, French Governor of Louisiana, who conducted an expedition into the country south of St. Louis in 1715. The failure of the Mississippi company organized in France by Law led to the abandonment of extensive plans for the operation of this property, and the concession was ceded to the French Crown in 1731. For 150 years it has been a producer, the estimated annual production during the first fifty years being 100 tons per annum with the crude mining and smelting methods then in vogue. In 1819 the production had risen to 400 tons a year. In 1823 five lead furnaces were in operation.

Smelting on this property has been in constant progress for more than 110 years. Steam hoisting plants were first installed in Missouri at Mine La Motte. During the latter half of the century Mine La Motte's lead production increased heavily, being in 1870 as great as it was in 1901. Two years later a fire destroyed twelve furnaces on this property and the output was reduced markedly, four years later having touched 2914 tons. During this same period nickel and cobalt ores were first utilized. In 1892 the property yielded 4403 tons of lead—all from the surface workings—gophering.

The ore consists of sulphide of lead associated with sulphides of nickel and cobalt, and is interspersed with sulphides of iron and copper. The ore is disseminated through magnesian limestone, few fissures of value having been developed, and the deposits being cut out for considerable areas from each shaft. An electric drill plant is operated, the ore being trammed to a mill of 110 tons daily capacity. A smelting plant of three calcining ovens, one large and one small smelting stack and one refining furnace is in operation. A power plant of ten hollers and engines, three diamond drills and a complete system of water works are included in the mine equipment. Considerable deposits of disseminated lead have been proven with diamond drills, and the annual output of the property for the past few years has averaged from 2250 to 2500 tons of pig lead. All the nickel and cobalt produced in the United States last year came from this property, the matte being refined in New Jersey.

*A paper read by A. VON DER ROFF, Superintendent Selby Smelting & Lead Works, at the Convention of the California Miners' Association Nov. 17, 18, 19, 1902.

An El Dorado County, Cal., Head Frame.

Written for the MINING AND SCIENTIFIC PRESS by C. H. WILDMAN.

During the summer a new head frame was erected over the Flagstaff shaft of the Mt. Hope mine in El Dorado county, Cal., of which the following is a description:

The frame is of a modified A type, so designed that all the timber members are in compression, and tensile

down to the counterweight. This weight is a strong box, with an iron bale, and loaded with rocks until heavy enough to raise the door.

With the sliding rod in its normal position, the counterweight hangs at its lowest position, the door standing nearly vertical, the rope from it supporting the counterweight. As the idler rises with the bucket, when about 4 feet from the top of the head frame, the hook engages with the bend in the sliding rod, and lifts the latter along with it to the end of its trip, when idler and rod are supported by an automatic chair.

The result of lifting the rod is to lift the counterweight; the door, no longer supported, falls shut. With the idler on its chair, the bucket can be lowered, the door remaining closed. After dumping, the engineer raises the bucket until the clamp on the cable lifts the idler; the chair is withdrawn by a pull on a lever hanging at his hand. Then as the bucket and idler descend together, the counterweight also descends, raising the door in time to allow the bucket to pass down into the shaft.

This simple arrangement saves the usual labor of lowering and raising a heavy door by hand, and saves considerable time on each trip, and has proven altogether a convenience during sinking. No reason is known why it may not prove equally efficacious after a bin and self-dumping skip are installed.

Some changes would improve the working, such as using a square rod to prevent accidental rotation, which occasion-

Formation of Nuggets.

Written for the MINING AND SCIENTIFIC PRESS.

It has been stated that the presence of fine gold in fine gravels and coarser gold in coarser gravels may be due to the interstices in the gravel acting as a screen. It is not improbable that another theory might fill the conditions and offer a better explanation. May not the particles of gold of different grades of fineness have been made up of the smaller grains by agglomeration under the slow movement and pressure of the gravels?

If it is admitted that the gold was originally in solution, and, after finding its way into the gravel, was reduced to the metallic state by organic or ferruginous materials, why should there be any variation or such great differences in the dimensions of the grains? Why should not all be of the same size, or approximately, excepting such portions as become crystallized, which is not unusual in gravel gold. There is much that Nature performs in her laboratory which we cannot repeat in ours; the elements of mass and time are beyond our reach, but we know that precipitation generally—and of gold by organic and iron compounds in particular—results in an impalpable powder. It is conceivable that an excessively slow precipitation might result in crystalline forms, if such should take place from a saturated solution. It is also easy to conceive of conditions obtaining where the resultant of the precipitation found lodgement in cavities or cracks. Such being the case, by what process did the minute grains of precipitated gold become "fines" and "flakes" and the "flakes" become "coarse" and nuggets?

If two freshly cut, plane surfaces of lead are pressed together, they will cohere; if the pressure is increased, and a twisting, rubbing movement be given to the lead surfaces, the cohesion will be even better. It is necessary that the surfaces should be bright, with no oxidation.

Gold for dental work is superior to all metals,

Head Frame Flagstaff Shaft, Mt. Hope Mine, El Dorado County, Cal.

stresses are met by iron tie rods. For part of these a lot of old $\frac{5}{8}$ -inch iron cable was used, rove through eye-bolts, threaded to give the desired tension.

In place of tenon and mortise joints, dowels were used, made of 1-inch gaspipe cut in 3-inch lengths. Two of these, separated 6 inches to prevent rotation of the members, were used at each joint. This proved a quick and very satisfactory method of jointing, the amount of wood cut away being reduced to a minimum, and the cutting being of the easiest character—simply boring shallow holes with an expansive bit, for a driving fit. The holes were treated with coal tar to prevent decay around the dowels.

The frame has been roofed over the sheave, and on the upper parts of the sides, in the directions from which most of the stormy weather comes.

A clear height of 24 feet above the platform is secured; the intention being, when drifting and stopping are resumed, to put a receiving bin in front of the head frame, using a self-dumping skip.

During sinking an idler runs on the guides, carried about 6 feet above the bucket by a clamp on the cable. The cable runs through a hole in the idler, so that when the latter is resting on its chair, either at the top of the head frame or bottom of the guides (which are kept about 30 feet above the shaft bottom during sinking), the bucket can be lowered for dumping or loading.

The idler has on one of its upper corners a hook that projects alongside of one guide and just clears the shaft timbers. A bar of 1-inch round iron, about 9 feet long, with a hook at the lower end and a horizontal return bend at the top, slides up and down in iron guides along the outer corner of the shaft guide, near the top of the head frame. From the hook at the bottom of this rod a $\frac{5}{16}$ -inch wire rope passes down around a small sheave, thence up and away from over the shaft, around a second sheave, and down to a counterweight. Over the shaft is a door, hinged above the car-track, so that any dirt spilled on the door in dumping may fall into the car as the door rises to allow the bucket to descend. From a point about 3½ feet from the hinge, another wire rope runs up and over the second sheave, and

Detail of Head Frame, Mt. Hope Mine, El Dorado County, Cal.

ally leaves the rod in such a position that the hook on the idler fails to lift it. A strong, coiled spring at the point where the rope is attached to the door would reduce any jerk from rough handling of the hoisting engine. As the idea was new to the designer, it was a matter of cut and try and elimination of errors as they were revealed.

For a shaft where a door is necessary to protect the miners working below, this is a very convenient arrangement.

chiefly, if not entirely, by reason of this property—coherence. Gold will not oxidize.

It does not require much of a stretch of the imagination to see the analogy, and from which the conclusion can be drawn, that the grains of coarser gold and nuggets have been formed from the original metallic precipitate by the agglomeration of the minute particles, assisted by the pressure, the sliding and rolling, but slow movement of the gravel and boulders. In the finer and less massive gravel, with its smaller interstices, is found the finer and but slightly ag-

glomerated grains; among the coarser gravel and boulders are the coarser gold particles and nuggets. Part of this may obtain by the screening effect of the various sizes of the gravel, even though the interstices of the coarser gravel are generally filled with the finer material.

The conclusion, therefore, would seem to be that the finer gravels, by reason of the smaller mass and surface areas of the grains, agglomerate but a small portion of the grains of gold; and the agglomerated particles increasing in size as the surfaces of the gravel increase, take in, so to speak, a greater portion of the already increased gold particles. The increased coarseness of the gravels and consequent slower movement and grinding effect and the contact with more gold increase this agglomeration until "coarse" and, later, nuggets of increasing size are formed, as a snowball becomes a large mass after a trip down the hillside.

A not unusual feature in large gravel nuggets is a seam or faint line along one edge as if the gold had been folded over in the rolling and grinding operation, the folded surfaces welded together, the line showing the welding joint.

Raising Gravel in Placer Mining.

Will you kindly state in the MINING AND SCIENTIFIC PRESS whether centrifugal or other pumps are successfully used for raising gravel in placer mining.

Any information on this line will be much appreciated by me, and I have no doubt by other readers also.

Boston, Mass., Oct. 30, 1902.

C. A. PARSONS.

In answer thereto, Jno. Richards says:

In reply to Mr. Parsons' inquiry would say centrifugal pumps made for the purpose are suitable for raising gravel after it is quarried or disintegrated, the latter being the main process in working underground strata. There is no impediment in "raising" the gravel when it is delivered to the pump and has been passed through a grizzly or screen that will arrest boulders larger than two-thirds the diameter of the pipes. Pumps for this purpose should be of the triple-vane type to avoid scum on the sides, also to prevent sand from passing outward into bearings and around inlet nozzles. The passages are, of course, different from a water pump. Gravel is much easier to pump than sand, especially fine sand, which is liable to form a compact annulus in the pipes. Present practice here is extensive and successful, but one cannot well advise your correspondent without knowing the conditions under which the machines are to operate. Raising gravel is a comprehensive term. If auriferous gravel mining is meant, it is better to dig it and raise it at one operation by bucket dredgers, delivering it high enough to permit washing, as in the case of the machinery made by the Risdon Iron Works of this city.

San Francisco, Nov. 8, 1902. JNO. RICHARDS.

As is often the case, and as Mr. Richards points out, exact details are necessary to furnish exact reply. Possibly what Mr. Parsons refers to is what is sometimes called "pump dredging," though the term "pump dredger" is somewhat of a misnomer, since the machines do not work by dredging. The process consists of hydraulic sluicing, the necessary pressure being given to the water by a powerful centrifugal pump. The water and the gravel which it breaks down gravitate into a suction well or sump in the lowest part of the workings, and from this they are raised by another centrifugal pump and delivered into sluice boxes at a height of about 50 feet from the floor of the excavation. The bottom of the sluice box is fitted with the usual riffles, which retain the gold, while the water, carrying with it the gravel, flows over the end of the box to the dump. The machinery is all fitted on a pontoon so that it can be floated to a fresh position when desired. When work is about to be commenced on a deposit, and excavation is made of sufficient size to accommodate the pontoon, the water is allowed to accumulate in this and the dredger is launched. The excavation is then drained by means of the centrifugal pump, so that the pontoon can rest on the bottom, and the bank gravel is worked away by hydraulic sluicing. When the excavation has been so much enlarged that the shifting of the dredger is desirable, this is effected by letting in the water and floating the pontoon to the most convenient position for continuing the work. The pump dredger has advantages under certain conditions. Thus, where the bedrock consists of hard and uneven rock, it would be difficult to obtain the gold lodging in the crevices other than with the so-called pump dredger. Where a deposit of gravel exceeds 50 feet in depth there should be nothing to prevent its being successfully dealt with by the method of hydraulic sluicing and elevating. When the question of cost, however, is considered, the comparison is in favor of bucket dredgers, which can be worked by two men per shift of eight hours, while the pump dredgers require eight men per shift. Moreover, as much more powerful engines are necessary for the pump dredgers, the consumption of fuel with these is greater than with the bucket dredgers. In the case of deposits of gold river gravels of moderate depth, resting upon soft bedrock, the bucket dredger is deemed the cheapest and most efficient appliance for recovering the gold; where the deposits

are of great depth, or the bedrock is too hard and uneven to allow of the employment of bucket dredgers, pump dredging could be successfully employed, provided the gravels be sufficiently rich to cover the extra cost.

There is a gravel pump method in use in West Australia, which in a general way may be described as follows:

The system consists first in excavating a portion of the gravel to be worked down to bedrock, which may be 10 feet, 15 feet or 20 feet in depth, as the case may be; the bedrock is then levelled, and upon this spot is constructed a wooden barge 30 to 40 feet square, according to the size of the plant, and 3 to 4 feet high, constructed to withstand the vibration and weight of powerful machinery. Upon the deck of this barge is installed the plant necessary for breaking down the alluvial banks and recovering the gold therefrom, consisting of a boiler and horizontal engine, ranging as high as 180 H. P., two centrifugal pumps, 12 to 14 inches, placed on either side of the end of the barge, facing the drift; these pumps work on the one shaft, and are connected by beltting with the driving wheel of the engine; the right-hand pump is the gravel pump for carrying the alluvial to the sluice boxes, the left-hand pump supplies the force of water for the giant nozzle. A suction pipe leads down from the gravel pump to a sump or well below and near the end of the barge from the same pump, a delivery pipe leads up to the sluice boxes overhead which stand on trestles at a height regulated by the depth of the gravel to be worked, and having a grade of about 1 in 20. These boxes are usually of iron, 3 to 5 feet in width and about 100 feet long, fitted with diamond riffles at the head, followed by punched or slotted steel riffles. Mercury is spread down the boxes. The gravel pump contains a hard cast-iron liner, likewise the hollow fan, which revolves inside the drum, both these can be removed when worn through; in some ground, hard angular stones of great size will wear a liner out in six weeks, but in better ground will last twelve months. Attached to the nozzle pump on the left is a pipe leading to the giant nozzle, and another suction pipe leading to a second sump on the left-hand side of the barge, where the returned water is received. On starting work the water from the creek or reservoir is allowed to flow into both sumps, the suction pump drum is primed by means of a jet of steam displacing the air and the machinery is set in motion, with the result that the water from the nozzle pump is discharged against the gold-bearing drift, washing it down the gutter to the gravel pump sump, its force being equal to 75 or 100 feet head. Water, gravel and gold are then carried by the power of the gravel pump through the discharge pipe to the sluice boxes overhead, the tailings falling at the end of the boxes and forming a mound. The water separates out, and is conducted back to the nozzle pump sump, and so forms a circulating motion, with the exception of the loss by soakage.

Two important points which require further explanation are, the elevation of the sluices to such a height, and the construction of the plant on a barge. The elevating of the sluices allows the tailings to fall behind in the form of a ridge or mound, and by the time the mass of tailings have reached inconvenient proportions, the working face of the drift has receded a considerable distance from the barge, and then the discharge pipe is disconnected, the suction pipe raised, the water allowed to accumulate in the worked-out ground, and the barge with its burden floated up to a new position and work re-commenced. Thus flat or gulch when worked out leaves a series of undulating mounds of worthless tailings behind to mark its track.

A plant such as described is figured to be capable with a 12-inch gravel pump of lifting 60 to 80 cubic yards of gravel ground to the sluices every hour, and to require but four or five men a shift. Work proceeds night and day, incandescent and arc lights being used at night time. Large areas only worth four or five grains to the yard are there worked at a cost varying from 5c to 12c per cubic yard, according to the nature of the bedrock. This is solely as to the pressure for the giant nozzle and the deposition of the tailings. Regarding the water supply, assuming that there is a large area to be treated, the first step would be to bring sufficient supply of water which would necessitate excavating an immense tank; then in addition to the supply of water in the tank at the natural water level, the supply is strengthened by running trenches from the main tank far into the lake; the next step, erecting a pumping station as near the tank as possible; next, laying suitable pipes from the pumping station to the ground. To ensure a plentiful supply on hand, it would be necessary for these supply pipes to terminate at a main reservoir, which should be situated on the most advantageous part of the ground, in order to command the works, and shall not be less than 100,000 gallons. As regards the installation of the barge and machinery already described, care would have to be exercised that the starting point was on lowest portion of the ground in order, as the work proceeded, to give a slight fall towards the suction pipe. Eight to nine-inch pumps should answer the requirements on this field; but this would be regulated by the water supply. Should it be found that the salts in the water corroded the water supply

pipes in spite of a coating of asphaltum, this difficulty could be got over by having the supply pipes constructed of wood instead of steel. An 8 to 9-inch gravel pump would be capable of dealing with about 35 cubic yards per hour, and would require about 40,000 gallons of water to treat the material running over the sluices during one hour. In order to keep the gravel and nozzle pumps constantly at work after the main reservoir was filled, a pumping plant at the lake would be required capable of supplying 16,000 gallons per hour, and by returning the water in the manner described this would give the quantity required, after allowing the loss of one-third for soakage. Having the reservoir full, work could be carried on for several hours in the event of anything going wrong with the water supply plant.

Cliff Climbing.

Every cliff is climbable in some way, as Prof. Lihney has proved at the "Enchanted Mesa" in New Mexico, but not every cliff is to be climbed by ordinary methods, or with muscular effort unaided by mechanical contrivances. Yet few cliffs are as steep as they look to be, and many "inaccessible" places, so called, can be scaled by the means of good judgment and a cool head. The author was told that the walls of a certain canyon had never been climbed by man, at a time when he had climbed it in three places and had carried a gun up one of them. Looking from below, all slopes appear exaggerated, and the little inequalities of the rocks that afford support to hands and feet are invisible.

There is a great difference in cliffs of different sorts of rocks in regard to the facilities afforded to the climber. Limestone is much the best in this respect. It wears to a rough surface, it breaks in angular chunks and it does not crumble. Besides that, the limestone frequently occurs in beds of varying hardness, and these result in shelves along the face of the cliff, which greatly facilitates cliff climbing.

Granite cliffs are inferior to limestone for climbing. The surface is smoother, it crumbles more and different parts of the same cliff may vary greatly in these particulars. Sandstones are difficult to classify as a whole. Some of them nearly approach the limestone in firmness and reliability, while others are as crumbling and as dangerous as rock can be. The softer rocks seldom form cliffs, and a wall which is firm enough to withstand the assaults of the wind and rain is usually solid enough to bear the extra strain of a man's weight.

Cliffs of the harder volcanic rocks, such as basalt and obsidian, are seldom to be climbed. The surfaces are smooth and hard and the slope is often truly vertical.

The best and the safest climbing is upon bare rock which is absolutely free from anything else. This is a reason why cliff climbing is nowhere to be followed with greater pleasure and safety than in the Rocky mountains. Whatever appears upon the face of the cliff apart from the main mass of the rock wall should be regarded as a delusion and a snare. Loose rocks, gravel, grass, bushes, roots, branches of trees, moss and even moisture upon the rocky surface add immensely to the difficulties and dangers of an ascent.

Falling timber adds very greatly to the danger. It is impossible to tell how firmly a trunk is rooted or how much weight will upset its balance, except by actual experiment. After the experiment the knowledge is useless.

Many of the dangers supposed to be inseparable from cliff climbing are the result of improper clothing. Anything that will catch on the rocks or that will impede the free movement of the limbs is of course to be avoided, while the ordinary shoe is about as bad for the purpose as anything that could be devised. What is needed is something that, while protecting the foot from the rock, will adapt itself to all inequalities and give a firm support without slipping. The nearer the shoe approaches the conditions of the naked foot the better it is for climbing purposes. In case of danger it is a good rule to remove the shoes entirely. An observance of this rule once cost me a 2-mile walk, stocking-footed, over the pebbles, but that was better than lying at the foot of the cliff indefinitely. The only thing I regretted was that I had no more sense than to throw my shoes to the bottom of the cliff, where they are yet, instead of tying them about my neck as I should have done.

In cliff climbing, as well as in mountain walking generally, it is a bad plan to depend on toes or heels. It is the sole which is intended for walking and climbing, and it is the best, the surest and easiest for the purpose. Besides it doesn't wear out the shoes nearly so fast.

Cliff climbing is up-hill work. There is no science of climbing cliffs downwards, and there is not likely to be until a man gets eyes in his feet so he can see where he is going. There are a great many cliffs which can be easily and safely ascended, but whose descent is an alternative between a fall and a jump. It is a good plan in cliff climbing to come down some other way, and a very safe precaution to take before making an ascent is to make sure that there is another and safer way down. The most serious acci-

dent that I have known resulted from a lack of this precaution. A young man climbed to the summit of one of the cliffs at Cheyenne canyon, Colo., only to find himself on an isolated pinnacle of rock. To descend by the way he came was impossible. With great difficulty, and in deadly danger at every moment, he worked his way around to the opposite side of the conical rock, descending gradually, but finding no way to reach the level beneath. It was a long strain on muscles and nerves. The rock was so steep that a position could only be maintained by the use of both hands and feet, and the relaxation of muscles meant a certain fall. And end came with the gathering darkness. To stay through the night was an impossibility and aid was not to be expected. The only thing to be done was to diminish the inevitable fall as much as possible. He wrote a letter, placed it in his hat, and then started downwards. His last remembrance was of sitting and sliding towards the edge of the slope. The fall, as afterwards determined, was about 50 feet, though this was not a direct drop, but rather a sliding and rolling upon the rocks. When he regained consciousness the stars were shining and he was lying upon a gravel slope at the foot of the cliff. Just above and within reach of his hand were the branches of a spruce tree, which may have broken his fall. His clothes were badly torn and soaked with blood. He was generally bruised, scratched and cut. The worst injury was a compound fracture of the lower jaw, caused apparently by a blow from a projecting rock upon the point of the chin.

What good does it do? Cliff climbing is an amusement, like others. The chief object is not in the result, but in the doing. There are and have been professional cliff climbers, such as the cliff dwellers of early America and the hunters of Norway. An experience of cliff climbing is often useful in surveying and in prospecting for mines. But the amateur needs no other object than the pursuit of his purpose.

The chief charm in cliff climbing comes from the conquest of danger. That this is ever present, can not be denied; but with fearlessness and good judgment danger may be overcome and done away with.

A "Take-up Device" for Indicators.

The great trouble experienced when using the detent on the steam engine indicator is that of the slack given up by the cord between the paper drum and reducing bushing on wheel. This slack, if not properly guided when throwing on detent, is liable to foul, thereby in many instances wrecking the instru-

Take-Up Device Attached to Indicator and Wheel.

ment or at least breaking the cord, causing delay and inconvenience to the operator. The take-up device is presented for the purpose of doing away with such annoyance. It is simple in its construction and can be applied to any standard indicator.

It consists, as will be noted by reference to the illustration, of a short horizontal arm, at one end of which is a vertical bearing, in which sets a steel pillar on the upper end of which there is a frame holding a double set of loose steel rollers, between which the cord from paper drum passes. On the lower end of vertical pillars there is a light spiral spring inclosed. This spring causes upper frame to revolve when cord becomes slack, and is so arranged that cord winds on frame, to be given up when tension is applied.

The object of the device is to permit the operator to take as many cards as desired without unhooking from the crosshead or stopping the engine, no matter what speed. This of course pertains to indicators that are fitted with a detent and using a direct connected reducing motion.

Where an indicator is used in connection with pendulum, lazy tongs or reducing motion attached to engine frame, less trouble arises; generally a rubber band is employed to take care of slack

C. M. Belshaw, Elected President California Miners' Association at Eleventh Annual Convention, in San Francisco, Nov. 19, 1902.

cord, which works fairly well. In this case the take-up device is arranged in the shape of a regular guide pulley to connect direct to indicator, the guide pulley is removed and this put in its place, wound up and ready for use. It can also be used with satisfaction as a guide pulley if not needed to take up slack cord, as the little pulleys are arranged to let the cord run through with perfect freedom, and immediately the detent is engaged, it picks up instantly what slack cord takes place. The tension of the spring in this device, being so much weaker than the drum spring, soon as detent is disengaged, the cord is instantly released and drawn out taut and assumes its regular position.

The take-up device is likewise attached to engine frames and used in various other ways. It is strong, well made and compact and makes an attractive attachment. It is good for any number of revolutions and is designed to fit all standard indicators and reducing wheels, or it can be made as a special fixture. It is made by J. L. Robertson & Sons, 195 Fulton street, New York City.

Dry Crushing, With Direct Amalgamation and Cyanidation.

In a discussion of stamp mill work and ordinary amalgamation processes, John Yates, describing what may be styled the MacArthur-Yates method, says:

"After freshly dressed plates have been inserted in the frame, ore and cyanide of potassium solution, in the proportion of 2 to 1, respectively, are charged into the harrel together, the amalgamated plates being vertical. When the barrel has received its full charge of 2½ tons of ore and 1½ ton of cyanide solution of suitable strength, the charging aperture is closed, a tight joint being secured by means of a rubber washer. The barrel is then started, and is driven at about fifteen revolutions per minute for one hour, when it is stopped as quickly as possible by means of the brake, with the aperture uppermost, the cover is immediately taken off and the barrel given a half turn to discharge. The discharged harrel is then turned over to permit of the

amalgamated plates being got at. These are released by knocking out the wedges and are placed on a light tray, duplicate plates which have been dressed being substituted. The barrel is then ready for another charge. From the discharge casing the pulp passes by a launder to one of the percolation vats, each of these vats taking the twenty-five hours' output of the whole of the barrels, and the ore is subjected to a complete percolation treatment in them."

From the above description it will be seen that the process is, in the main, the ordinary cyanide percolation process, the distinguishing feature being that the ore is subjected to a short preliminary agitation, with the view of securing the amalgamation of as much of the gold as possible and thus raising the extraction.

F. L. RANSOM of the United States Geological Survey, in his report on the "Deposits of the Rico Mountains, Colorado," cites the occurrence of two minerals new to Colorado—wollastonite, a silicate of calcium, associated with chlorite, epidote, garnet and other minerals, and halosite, a massive, clay-like mineral, essentially silicate of aluminum, occurring as alteration product in the Logan mine.

The Turbine Equipment at the "Soo."

The power station at the Sault Ste. Marie, which was put into commission a few weeks ago, is a large example of the application and development of water power from a low head. It took months of experiment and study before being perfected, and as installed has one point of advantage over the Niagara Falls equipment in the efficiency of the turbines. The type of turbine used in the Soo equipment is the McCormick turbine.

The usual method of setting turbines has been to place the wheels so as to revolve in a horizontal plane, the shafts being vertical. With the advent, however, of expansion in the electrical field, and the application of water power to the generating of electrical currents, it became necessary to set turbine wheels in a vertical position on horizontal shafts. When the Michigan Lake Superior Power Co. prepared its plans for the new power house this setting was finally determined on. Up to this time tests of wheels had been made on a vertical step at the Holyoke Water Power Co.'s flume in Holyoke, considered to be a reliable testing station, designed by Francis and constructed by Clemens Herschel. This type of flume was used by Francis to obtain his formulae for calculating water powers, which are authoritative. To make tests on wheels in a horizontal setting required considerable expenditures and an arrangement was finally entered into between the Power Co., the Webster, Camp & Lane Co. and J. & W. Jolly, Holyoke, to design, build and test a turbine unit which should fulfill the following requirements:

With a 16-foot head the unit must develop 568 H. P. at 180 revolutions with an efficiency of 80%, tests to be made at Holyoke under the supervision of Prof. G. S. Williams of Cornell University. After months of experimenting with improved forms of wheels and various designs of draft cases and draft tubes, the final design was adopted. The best results finally obtained were as follows: Head, 16 feet; speed, 180 revolutions per minute; H. P., 584; efficiency, 84%. These figures speak for themselves. The penstock unit as illustrated consists of four turbines arranged in pairs with one draft tube for each pair. Each pair is keyed to an open hearth hammered steel shaft and the two shafts are bolted together by means of forged couplings. The shafts are designed to transmit double the power of the generators with the usual factors of safety. This is to provide against the torsional vibrations caused by generating an alternating current. Each pair of the turbines discharge into a central conical ended draft case, and the discharge is continued to the tailrace by means of a conical steel plate draft tube. The draft cases are made of cast iron and are separable in a horizontal plane parallel with the turbine shafts, making them easy of access. The center of each case is provided with a yoke or steady rest for the turbine shaft. The combined water wheel shaft is supported by three heavy cast iron pedestal girders that rest on the side or foundation walls of the penstock. The water bearings are amply large and are made from specially prepared wood blocks. These are hacked with iron and can be adjusted for water. The draft cases are supported by heavy spanning frames made from 15-inch steel I beams. These also rest on the side wall of penstock. This construction frees the arches over the tailrace from the weight of the machinery. The draft cases and pedestal girders

Penstock Unit Designed and Built by the Webster, Camp & Lane Co. for the Michigan Lake Superior Power Co, Sault Ste. Marie, Mich.

are tied together on each side by longitudinal bars, making substantial support for the running parts. The turbine shaft penetrates the curved bulkhead by means of a stuffing-box properly secured to the steel plates by rivets. The common horizontal gate shaft extends through the bulkhead into the dynamo room in like manner, and is provided with the necessary rigging to manipulate the gates of the four turbines simultaneously by hand or by machinery.

The turbine shaft at the end farthest from the dynamo room is 5½ inches in diameter and increases in size until it is 7¼ inches in diameter at the dynamo end, and is arranged to be coupled to the horizontal dynamo. Each of the four turbines is encased in a balance gate curb, while the individual gates are so poised as to direct the flowing water properly, and differently, at the different degrees of gate opening maintaining a high efficiency at part gate. This data is furnished by the installers, the Webster Camp & Lane Co. of Akron, Ohio.

BUT thirty-two days remain in which to do the required \$100 of work or improvements on unpatented claims. On unpatented claims located since Jan. 1, 1901, the time limit expires Dec. 31, 1902.

Deposition of Ore.

On the subject of ore deposition Dr. Becker of the U. S. G. S. says that with the exception when ores are deposited in beds, or in placers, like gold gravels, the existence of open subterranean spaces of greater or less size is a necessary condition for the formation of ore bodies of any kind. The ore may be deposited in openings which existed before deposition began, and which either were cracks between masses of rock broken asunder or were interstices in porous rock like sandstone. Room for the ore may also be made by solution of the rock mass either before ore deposition or during that process. It is a mistake, however, to suppose that the masses stopped out in the exploitation of mines usually represent spaces which were empty before the deposition of ore in them. It is said that cases occur in which open caves in limestone have been filled with ore, but cavities of this kind appear to be confined to limestone, and to have formed only above the water level of the district by the solvent action of surface waters charged with carbonic acid. Ore deposits, however, are by no means confined to limestones, and are more often found in rocks of this class which have never been drained than in those which have been exposed under the conditions needful for the formation of caverns. It is also conceivable that yawning fissures should form in the earth's crust, and that they should be filled up solely with ore and gangue minerals; but such cases, if they exist, are exceptional.

All observations and theory point to the conclusion that most fissures are formed under a compressive stress of greater or less violence, or that a tendency to compress the rocks into folds gives rise to fissures and faults when the applied force exceeds the tenacity of the rocks. It is also well known that in faulting the hanging wall commonly sinks relatively to the foot wall. Fissures formed under such conditions cannot yawn. The walls must come together at intervals, and the intervening spaces must be filled to a greater or less extent with the fragments of wall rock. Observation shows that veins very usually answer to this description and that the space occupied by ore corresponds, in great part, to the interstices between fragments of wall rock which loosely filled the fissure before the ore was deposited. This is observed with particular frequency in large veins, while small ones are comparatively free from rock fragments. Irregular ore bodies connected with fissures still more often represent masses of rock fragments rather than caverns.

In some cases irregular chambers, connected with fissures, are solidly filled with ore and gangue minerals. Such bodies are found in limestones under conditions which preclude the supposition that they represent pre-existing caverns and they are usually accompanied by evidences of substitution of ore for carbonate of lime. The deposits of Eureka, Nev., and Leadville, Colo., are of this type. In these cases broken rock seems originally to have filled the spaces in question, much as stopes in mines are often filled with rock by miners to prevent their collapse after the removal of the ore. Solutions of ore finding access to these spaces through the main fissures have come in contact with very extensive surfaces of limestone. The limestone has been dissolved and ore has replaced the rock, molecule for molecule. Whether similar substitution occurs in other rocks than limestone, and with other ores than those of lead, has not been sufficiently investigated.

Fissures in the earth's mass would extend indefinitely, both laterally and vertically, if the rocks possessed neither plasticity nor elasticity. No rocks, however, are devoid of either of these properties. It is well known, accordingly, that fissures are not of indefinite length. They sometimes pass over into folds, as several geologists have pointed out, and even in granite areas dikes of eruptive rock may sometimes be observed, which diminish gradually in width to a fine edge and disappear. There is every probability that fissures also die out in depth in similar manner, though where considerable faults have occurred the depth of a fissure must be very great. Many fissures certainly penetrate from the surface of the earth to the foci of volcanic atmosphere, a depth at least equal to that at which earthquake shocks originate, or several miles from the surface.

"When the term fissure vein is used without qualification it brings to mind a very simple and common form of deposit, a fissure with well-defined walls, usually nearly straight, or curving gradually and including vein matter which is commonly composed of ore gangue, and fragmentary masses of country rock. It appears to me very desirable not only to call a deposit of this kind a simple fissure vein, but to limit the application of this term to veins of this kind.

"Where the formation of a fissure is accompanied by a strong compressive stress groups of parallel fissures form, often passing over into a common fold at each end. The dislocation is then distributed over a number of parallel surfaces instead of a single surface, and this distribution takes place according to a definite law, which I have examined on other occasions. In some cases such fissures form with great

regularity and are distinct from one another as far as they can be traced. If ore-bearing solutions enter such ground they deposit distinct parallel veins. Such deposits are naturally described as groups of parallel veins.

"In many cases the tendency to the formation of groups of parallel fissures is obstructed, perhaps by irregularities in the tenacity of the rock or by the action of complex forces. In such instances approximately parallel fissures form, which die out in the direction of their strike, being replaced by others to one side or the other. More or less diagonal stringers must then exist, connecting the principal crevices. Sometimes fissures of this kind run together and separate again, without, however, diverging at any high angle.

"In all cases these veins are linked together by direct continuations of divergent strike or by small stringers intersecting the layers of rock which intervene between them. It appears to me convenient and natural to call such systems "linked veins," to distinguish them from simple fissure veins and parallel systems of veins on one hand, and from netted (or rectangular) veins on the other."

There are still other less usual groupings of veins which do not need to be christened. No one would hesitate to speak of a system of veins which radiated from a central point as radiating veins, or of a vein which sends off numerous stringers into the country rock as a branching vein, and such descriptive terms are clear and precise.

A slight degree of irregularity in the tenacity of the rocks or in the character of the rupturing force suffices to produce linked fissures instead of groups of parallel fissures. Greater variations in the rock or a torsional stress accompanying the dislocation will result in crushing portions of the country rock adjacent to the main fissure. This crushing will not, as a rule, be confined to a simple zone parallel with the fissure, but will reduce only occasional masses of rock along the fissure to fragments. When in such cases ore and gangue minerals are subsequently precipitated the deposit will be confined to the main fissure where the adjoining country is unbroken, but it will spread into the neighboring rock where crushing has occurred, the excrement ore bodies being nevertheless merely lateral extensions of the filling of the fissures. Miners then usually call the entire occurrence a fissure vein, and with no little reason, since the whole deposit is so violently and closely dependent upon the existence of a fissure. In some of the simpler cases of this kind even formalists will grant the applicability of such a term as irregular vein, or vein with irregular walls. "Pipe vein" has also sometimes been used to express structure of this kind, but this term has been applied in such various senses as to be objectionable. When the irregularity of the deposits is great it has been used for mining engineers and geologists to describe rather than to name them, to speak of stock works and impregnations connected with them, and the like. It does not seem expedient, however, to designate ore bodies so closely related by different names unless the connection is also expressed by some appropriate term. The connection existing between the various portions of a deposit is at least as important as the form of the various parts, and if miners err in giving a wrong impression as to form, the usual nomenclature of mining geologists ignores the close interdependence recognized in the language of the miners.

"It seems to me that deposits of this description may conveniently be called 'chambered veins,' and that the irregular excrement bodies of ore of such deposits may fitly be denominated vein chambers. I

which are to some extent chambered, or which show a tendency to chambering.

"In granites and gneisses it is not infrequently the case that simple fissure veins are formed which, from the croppings downward, are very irregular. I doubt, however, whether, if in these cases the surface still remained as it existed at the time when the fissure was formed, the superior portion of the deposits would be found to possess an equal degree of regularity. When a fissure is formed a fault almost or quite invariably accompanies it, for it is a force tending to elevate one portion of a region above another which usually produces the fissure. When a fault takes place it is well known that the hanging country is commonly depressed relatively to the foot wall, and a projecting edge of the hanging ground must then press and scrape against the foot wall. This wedge-like mass, not being supported at the surface by overlying rock, is greatly exposed to fracture, and will generally be more or less fissured, even when it is composed of firm material, such as granite. If ore deposition follows from solutions which reach the upper part of such fissure, the irregular cracks in the lip of the hanging country will fill with vein matter and the simple vein will be surmounted by a chamber or a series of chambers close to the surface.

"If a country he composed of rock of a feeble and variable tenacity the tendency of the ground near the surface to break up into irregular fragments will be much greater than where the country is firm and homogeneous, and the formation of chambers of ore close to the original surface is the more to be expected. The ore bodies which were found near the croppings of the Comstock lode were of this description, and so are most of the superficial cinnabar deposits of California.

"I propose for these irregular bodies found at the croppings of veins the name 'cap chambers,' to distinguish them from the lateral ore bodies of chambered veins. The term vein chamber, then, includes cap chambers as well as lateral chambers.

"So far as we know anything of the mechanical conditions of ore deposition, it appears from the foregoing paragraphs that many deposits which now appear as simple fissure veins must once have included cap chambers, and must consequently have come under the definition which I have proposed of a chambered vein. The cap chambers in these cases must have been removed by erosion. Where ore deposition has continued until all available crevices were filled, as has sometimes, but not always, been the case, it is evident that cap chambers will contain a comparatively large amount of ore, often more than will be found within an equal vertical interval far from the surface, where the fissure system is more simple. Such was the case, for example, on the Comstock lode. Such also may have been the case on the gold belt of California, and the immense amount of auriferous gravel would then not represent the erosion of contracted quartz veins, such as are now being mined, but of the cap chambers of the veins. This hypothesis greatly reduces the amount of general erosion which the existence of these gravels would imply."

New Type of Dryer.

Herewith is illustrated a new type of dryer of the same principle as the Cummer style "Salamander" and style "F" dryers, incased in 1-inch plates on the sides and with a corrugated iron cover which consists of two thicknesses of corrugated iron with the corrugations running at right angles with the cylinder.

New Style Cummer Dryer.

propose these terms to express the external form only, and to embrace irregular ore bodies contiguous to a fissure, whether they consist of reticulated masses, of impregnations, or ore deposited by substitution. A chambered vein may, then, be defined as a deposit consisting of an ore-bearing fissure and of ore bodies contiguous with the fissure which extends into the country rock. The term is intended for use in contradistinction to the term fissure vein, or, more explicitly, simple fissure vein, which is thus restricted to those cases in which the occurrence of ore is limited to a single, defined fissure. Transitions between the two forms are not infrequent, and such occurrences may be referred to conveniently as veins

Between these two plates is an asbestos air cell board that is non-conductive of heat. The plates which form the furnace and the side walls for the dryer cylinder have a 9-inch lining of firebrick, with an air space between the plate and the firebrick lining.

The illustration shows the dryer fitted with a Cummer patent mechanical stoker, but the furnace can be arranged with grates for burning any kind of fuel. The material to be dried is lifted by the elevator A into the feed hopper, discharging into the dryer cylinder C, which is driven by the large pulley and gearing shown in the end elevation of the apparatus. The shaft of this pulley carries a cone pulley

which drives the belt operating the stoker. The heated air from the furnace is drawn into the cylinder through the square openings E, and after passing over the material to be dried is discharged through stack K by a fan in the horizontal flue at its base. The holes E are protected by hoods, which prevent the material from dropping out while permitting the free entrance of air. There are registers D in the sides of the casing, which are used for regulating the temperature of the air before it is admitted into the cylinder. The dryer is made in several sizes, for use with coal, stone, marl, clay, slag, ores, concentrates, slimes and other materials by the F. D. Cummer & Son Co., Cleveland, Ohio.

An Automatic Dumping Frame for Shafts.

An arrangement for tripping and dumping huckets at the head of tunnel, mine and other shafts has recently been introduced for the purpose of reducing the amount of labor ordinarily required for this work. The general design is shown in the accompanying cut. Instead of the usual form of head frame with fixed sheave above the mouth of the shaft, the frame is made with inclined top timbers, the incline being 5 inches to the foot. Upon the frame travels a steel carriage or trolley, upon which is mounted the main hoisting sheave.

While the hucket is being hoisted the carriage is at the lower end of the travel, being held by the rails, which are bent upward to form a stop. When the bucket is hoisted clear of the shaft a stop prevents it from rising too high, but the winding of the cable still continues, and the carriage is thus hauled up the incline until it is automatically caught and held by a pair of latch bars at the head of the incline. The cable is then paid out and the hucket lowered upon a dumping platform, which has a slot to receive a loose chain attached to the bottom of the hucket and carrying a disk or hall at its end. The weight of the bucket tilts the platform, and the hucket is inverted, being held to the platform by the ball, which cannot

atomic weight of a body in the solid condition and its specific gravity. The atomic weight of mercury and lead is greater than that of gold because it takes a greater weight of mercury or lead than of gold to combine with a given amount of hydrogen or its equivalent. But the specific gravity of gold is the greater because the ratio of its weight to an equal volume of water is greater than the corresponding ratio of mercury or lead.

If a person standing on the wet ground touches one of the wires of an overhead electric circuit, will the body, through which the current passes from the wire to the ground, receive the full voltage of the line, or not?

Yes.

Does it matter whether the negative or positive wire is touched?

No.

Will a shock result in either case?

Yes.

La Cananea, Sonora, Mexico.

Sinking or Tunnelling.

In mining, as in other occupations, things are often done because they are considered proper, and without any thought on the part of the miner. Men, in a certain district, get into the habit of performing certain operations in a certain way and make no attempt to see if other methods would not serve them better. Because a certain method gives a good result in one case it is too frequently assumed that it will give good results in other cases where conditions are entirely different. The practical miner is apt to know his own particular mine very well, and this knowledge gives him a certain contempt for geologists, or other trained observers, who bring a wider knowledge and more unbiased judgment to the work in hand. Perhaps the conservatism of

in the vein, and is a tangible, self-evident thing to show a prospective investor. Again, shafts, vertical or inclined, that follow the vein will show up any changes in the ore and give a large amount in sight. Thus four shafts 50 feet down in a ledge 4 feet wide would expose 1680 square feet of the vein. A tunnel driven 200 feet through rock to cut the vein would expose but the section, the height and width of the tunnel, say 100 square feet. To expose a larger area, drifting must be done, and such drifts can be run with better discrimination at the foot of a shaft than has followed the ore.

In the great majority of cases the miner, working by rule-of-thumb methods and disdaining to go at a thing in a scientific way, proceeds in an altogether different way from that outlined above. Having staked off his claim, often located on the strength of an apparent outcrop of ore, or on the showing of a single shallow shaft, he proceeds to run a tunnel. The miner or prospector with limited resources wastes only his own time and money by such work. It is when the practical miner undertakes to open up a claim for some company floated with \$1,000,000 capital, or some other attractive figure, that great mischief is done. A tunnel is started to open the ledge, say at 200 feet. Now, assuming that the ledge dips into the ground vertically, that the slope of the hill is 45°, and that the tunnel is driven at right angles to the course of the vein, a tunnel 200 feet long will cut the vein at a depth of 200 feet. It is easier to tunnel than to sink this distance. The dirt and rock can be trammed much easier than it can be hoisted, the tunnel will drain itself and if the ground is at all wet there is no need of the expense of a pumping outfit.

So much for the advantages; as a matter of fact, the different factors are seldom as cited above. The evidence that can be gained from an apparent outcrop or one shaft is very misleading. A common error is to mistake the slope of the hill. Any ordinary hillside is very much more likely to be a slope of 25° or 30° than 45°, and the tunnel to open ground at 200 feet may have to be driven 400 feet. In a tunnel of this length the chances are that the ventilation will become bad at the heading, long waits will be necessary after each blast, work will proceed slowly, and finally some sort of ventilating plant will be necessary. Again the dip of the vein may be unknown, as the apparent outcrop may be slide-rock. If ore has been found in place, and the dip of the vein determined by one shaft, still the pay value may be confined to a shoot or chimney, the limits and inclination of which, in the plane of the vein, are altogether unknown. In such case the tunnel expected to strike a vein in 200 feet, approaching from the foot-wall side, may fail to reach it in 500 feet. When finally cut, the vein may be absolutely barren. The section exposed is just the size of the tunnel; whether there is rich ore to right, to left or below it, is absolutely impossible to say, except by doing what might have been done in the first place, that is, by following the vein. In the case of a mining company that has gone into such a venture on a non-assessment plan, the end comes quickly and certainly. The funds raised from selling stock are used up in driving the tunnel 200 feet or more. Failure to find the vein where expected lessens the value of the stock. To keep on with the tunnel the treasury stock reserve is sold at a sacrifice and finally the company finds its treasury bare and nothing but a barren vein to show. The stockholders are out of pocket and the locality gets a black eye.

Of course, tunnelling and drifting are used frequently to advantage in opening up mining properties, as one can see in any famous camp in the West; but tunnels should follow preliminary examination and be laid out as the result of definite knowledge. If the formation of the vein dips with the hillside so that a tunnel will strike the hanging wall, it may be quite possible to open up the vein at a depth of 500 feet by a tunnel of only 200 feet. Here the advantage of the tunnel is evident. Again, if the ground is very wet, as it may be in regions where the rainfall is heavy, the cost of getting in pumping machinery may be so great as to make tunnelling a necessity. Some of the newly opened districts at Washington and British Columbia show this. Then there is the case where the course of the vein cuts across the slope of the valley so that one end of a 1500-foot claim is considerably higher than the other. A tunnel, or more properly drift, is then the only way to open the ore. Such a tunnel, being always in the vein, will show any variation in width and value, there will be no trouble from water, and the property will be opened at the smallest expense possible.

Though miners generally make the mistake of drifting or tunnelling instead of following the vein by a vertical or inclined shaft, yet one sometimes sees opposite mistakes made. During the excitement over the discovery of the Mesabi Range in northern Minnesota some years ago, a company was formed to work one of the very few places along the range where the iron ore formation or jasper was exposed. The company was capitalized at \$3,000,000, built an expensive camp, and hauled in a lot of machinery at great expense through the virgin forest. The outcrop formed on one side a bluff 50 feet or so high. Standing at the foot of this bluff any one could see, as the banding of the rock was horizontal, the changes in its composition; yet those who had

Automatic Dump for Shafts.

pass through the slot. The empty bucket is then hoisted into position again and the latches released. Then, as the cable is unwound, the carriage runs back to the shaft and the hucket descends.

The operation, as described by the Engineering News, is said to be very rapid and reliable, and is entirely controlled by the man at the hoisting engine. The apparatus can be so arranged as to dump into different pockets or bins. The plant is being introduced by Fairbanks, Morse & Co. of Chicago, and has already been installed by the Forest City mine at Leadville, Colo.; the Alcazar Mining Co. at San Antonio, N. M., and at other mines in Colorado and Arizona, where labor is scarce and expensive.

Some Questions and Answers.

If a dynamo were placed in an enclosure from which the air had been exhausted, would it generate a current of electricity?

Magalia, Cal.

The generation of an electric current in a dynamo depends upon the cutting of magnetic lines of force by an electric conductor. This would take place in a vacuum as well as in the air.

A number of us here want to know why are the atoms of mercury and lead heavier than those of gold? The specific gravity of gold is greater than that of mercury and lead. In other words, why is the atomic weight of mercury and lead greater than that of gold? All atoms are of equal volume—why the difference?

Glendale, Or.

The assumption that "atoms of mercury and lead are heavier than atoms of gold" begs the whole question. This matter is all only theoretical. Science everywhere accepts the atomic theory, for though it is only a theory and can not be proved, yet everything acts as though it were true and had been proved—hence, is not gainsaid.

There is no direct and simple relation between the

the average miner and prospector in the Rocky mountains, or on the Pacific Slope, is most evident in his clinging to the idea that the best way to find out what there is in the vein he has located is to "prove it with depth" by a crosscut tunnel.

As a matter of fact, when a miner has staked out his claim the first and most essential thing is for him to determine, as nearly as he can with the means at his disposal, the direction of the vein. Thus he will know whether his location really covers the vein, thereby very likely saving himself a heart-breaking lawsuit should the vein prove valuable. In case the surface debris is not deep, say 10 feet or less, it will not take him very long to dig some surface crosscuts the whole width of the vein. He will find out also whether the ore that he located is really in place, or whether it is slide or float rock from higher up the hillside. Having determined the general direction of the ledge, and opened it, if the surface is not too deep, in at least four places on a claim 1500 feet long, the next thing to do is to sink on the ledge far enough to determine accurately its dip or the inclination at which it slopes into the ground. Then if, as stated, the vein has been opened up at at least four points, several hundred feet apart, a careful analysis of the rock from the bottom of the different pits or crosscuts will show whether the vein grows richer in one direction than in another, or carries fairly uniform values. Having ascertained this much, the prospector is in a position to go to work systematically. He can decide whether he shall sink his shaft deeper or run a tunnel. He can also tell where is the best point to locate his shaft or tunnel so that it will show up the vein to the best advantage.

Generally speaking, the best advice that can be given in opening any mineral deposit is "follow the ore." There is no other way by which the ground can be shown up so thoroughly, and the ore taken out will go often a long way toward paying expenses. Even if the ore is not rich enough to pay for shipment, it is always evidence of the value of the rock

charge of the exploration had so little judgment that they actually started sinking on the top of the bluff, so near the edge that the rock brought up was dumped over it. Such work, of course, could have but one result. The company started off with a flourish, selling stock right and left. A year later the sheriff, looking for some unattached property against which a claim could be laid, found only a desk in the office at Duluth, and even this, as it proved, had not been paid for.

Mining and Metallurgical Patents.

Patents Issued November 18, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE MIXING MACHINE.—No. 713,694; J. P. Schuch, Cripple Creek, Colo.

Ore mixing machine comprising following elements: Ore mixing tank, false bottom including strainer, means for discharging air beneath strainer to keep meshes thereof free from any accumulation of slime, air supply pipes disposed above strainer to effect aeration of contents of tank, track carried by upper outer portion of tank, agitator shaft having upper portion polygonal in cross-section, spider having hub engaging polygonal portion, carrying traveler wheels at extremities to engage track, agitator bars suspended from spider, beaters or stirrers carried by bars, each set being disposed in break joint order with relation to adjacent set of beaters.

CONCENTRATOR.—No. 713,814; A. Ten Winkel, Denver, Colo.

Combination with transversely inclined concentrating table having movement tendency to carry material longitudinally from head toward tail of table, means at one of upper corners of table for feeding pulp thereto, water receptacle mounted on table covering suitable area at ore feed corner, screen located above water receptacle, intermediate plate provided with projections having openings in upper extremities forming nozzles, means for introducing water to water receptacle, forcing it up through nozzles, thence through screen arranged to receive pulp as fed to table.

PROCESS OF COMBINING TITANIUM WITH IRON.—No. 713,802; A. J. Rossi, New York.

Process of combining homogeneously with iron a

certain predetermined percentage of titanium which consists in bringing together mixture of titanic acid and iron, with carbon sufficient to deoxidize titanic oxides, proportion of titanic acid to entire mixture regulated so as to secure in product derived from next step from 2% to 5% titanium, next supporting ingredients, subjecting them to heat 3500° F., until iron and titanium resulting from deoxidization of titanic acid, are thoroughly molten and homogeneously commingled, withdrawing molten mixture from temperature, allowing it to solidify; reducing to molten state, while suitably supported by application of temperatures usually required to melt iron, both iron to be titanized and quantity of solidified mixture required to impart to resulting final product required percentage of titanium, continuing support subject to last mentioned temperature until constituent titanium has been melted and homogeneously distributed throughout mass, finally withdrawing product from the temperature and allowing it to solidify.

ORE CONCENTRATING TABLE.—No. 713,747; I. A. Cammett, Denver, Colo., assignor to Denver Engineering Works Co., Denver, Colo.

Concentrating table having table surface embodying series of raised ribs or riffles which in part are raised on both sides, and in part are raised only on one side, forming step-like formation, line or zone of demarcation between such part being less oblique to ribs on upper or higher side of table and more oblique or transverse to ribs on lower or tailings side of table.

BLASTING FUSE.—No. 713,878; Heath & Taylor, Cripple Creek, Colo.

Body portion having flared open end, fuse with end inserted in body portion, combined with protecting waterproof covering having inner end frictionally held compressed between outer surface of fuse and inner surface of flared portion with outer end extended beyond outer end of flared portion bent back over end thereof embracing outer surface.

ELECTRIC FURNACE.—No. 713,923; A. A. Shade, Chicago, Ill.

Electric furnace provided with interior passage, means for feeding material to upper end, crucible at lower end, electrodes arranged to form plurality of arcs in passage, one located immediately above open end of crucible, oblique ledges located below certain arcs extending into path of material, magnets in wall of furnace adjacent to ledges, magnet below crucible, means acting to localize effect of upper magnets to elongate adjacent arcs toward ledges.

PROCESS OF PRODUCING METALLIC ANTIMONY.—No. 714,040; T. C. Sanderson, Chelsea, N. Y.

Process of producing metallic antimony, providing molten bath of sulphide iron; immersing in bath antimony sulphide ore; adding suitable reducing agent for reducing antimony ore; running off metallic antimony from bath, whereby process may be carried on continuously for reduction of repeated charges of antimony ore.

AUTOMATIC BUCKET DUMPING MECHANISM.—No. 713,932; T. E. Anderson, Denver, Colo.

Automatic bucket dumping mechanism, combination with bucket and cable connected therewith, of framework provided with inclined track, carriage mounted on track, sheave journaled on carriage, bucket cable passing over sheave, stop on cable arranged to engage carriage and limit movement of bucket independently of carriage, normally balanced platform, vertical guides beneath track and between ends in which platform is vertically movable, capable of rotation at either end, pendant attached to bucket and arranged to catch on platform, means for holding carriage against downward movement while cable is slackened to allow bucket to rest on platform, arrangement being such that platform is tipped and bucket dumped suspended in inverted position, means for automatically releasing carriage as latter is drawn upwardly on track, whereby as cable is subsequently slackened carriage and bucket will move downwardly on track to original position.

APPARATUS FOR ROASTING ORES.—No. 714,099; W. F. Collins, Boston, Mass.

In apparatus for roasting ores, furnace, substantially arranged open ended tube extending through furnace, one end of tube being perforated, combustion chamber surrounding perforated portion of tube, plurality of retorts surrounding tube extending through furnace, retorts each communicating with combustion chamber, means to rotate tube and retort, construction being such that air to support combustion in combustion chamber is drawn through tube.

Carnotite.

Carnotite is a vanadate of potassium and uranium. It occurs as a yellow crystalline powder, or in loosely cohering masses, easily separated by the fingers. It is intimately mixed with a quartzose sand. The formula given for it is $K_2O \cdot 2U_2O_5 \cdot V_2O_5 \cdot 3H_2O$, deduced from the following analyses (after separation of silica) of air-dried material:

V_2O_5	U_2O_5	K_2O	H_2O
20.12	63.54	10.37	5.95—99.98
20.31	64.70	10.97	5.19 Fe_2O_3 0.96—102.13
19.95	62.46	11.15	... Fe_2O_3 0.65

It occurs in Montrose county, Colo., in cavities or associated with malachite and azurite. Some samples show 60% silica, the purest 2.6% to 7.2%. Separation is accomplished by nitric acid.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Cook Inlet reports that the Polly M. Co. has rich ground, and next season will put in a hydraulic plant. The Silver Tip mine has been bought by Eastern men, who will work it on a large scale during the summer of 1903.

Manager J. Girdwood of the Crow Creek M. Co. expects to have his hydraulic plant in running order June 1, 1903.

The largest nugget ever found in Cook Inlet district was picked up by A. Davis, one of the workmen in the Bear Creek mine. O. H. Sleeper is manager. It weighed sixteen ounces; its value was \$275 at the San Francisco mint.

At Nome, previous to 1902, the work on the Seward peninsula was largely of a superficial nature, but during the past season more real mining has been done. Ditches have been dug and water brought in for hydraulicking, notably the Miocene and Topkuk ditches, the Wild Goose Co.'s option ditch and that of the Hot Air M. Co., the last named being 5 miles long, grade 6 1/2 feet per mile. The gravels of this district are loose, with few boulders, not requiring a heavy pressure of water to wash it down. On Anvil creek, Candle creek, Gold Run and Bluestone it has been found that there is more gold in the benches than in the stream beds. The work done this season has proven that there are extensive deposits that could not be sluiced with profit, which will give good returns if hydraulicked. Quartz mining is getting a start. At the Burrah ledge, near Solomon, a 10-stamp mill is being put up. Work has been done on quartz claims on Snow gulch, Rider creek and in the Golden Gate district.

ARIZONA.

COCHISE COUNTY.

Fifty-seven mining locations were filed for record in the recorder's office during the past week.

The Calumet & Bisbee Development Co. is reported organized at Bisbee. Their property adjoins the Lake Superior & Pittsburg property, Warren district.

The property of the Tombstone Con. M. Co. will be unwatered, when miners will go to work in the stopes and drifts.

The Miner describes operations at the Bisbee-West, where a three-compartment shaft is being sunk to a depth of 1000 feet. There is one shaft on the mine down 740 feet, with 1300 feet of drifts. The company has a franchise to supply Bisbee with water; 4-inch mains will be laid through the town and the water piped from the mine to Bisbee; oil will be used as fuel. The pumps will raise 300 gallons per minute. The engine for pumping the water is built on the air system; instead of the exhaust being wasted, it goes down to the next station and forces the water pump there. The camp is 12,000 feet across the mountain from Bisbee and 6 miles around by the wagon road. Superintendent Dwight expects to have fifty men employed.

R. Oates of Calumet, Mich., has organized a company that has bought the Blair claims, adjoining the South Bisbee property, for \$200,000, paying \$75,000 thereon.

The Bisbee Miner reports that the Modern M. Co. will unwater the shaft, when sinking will be resumed. In the drift on the 200-foot level assays show 3% copper, \$5 gold, \$1.85 silver. The general formation is schist between lime and porphyry. The shaft is down 230 feet.

The Phelps-Dodge smelter at Douglas will have five furnaces, each 204 by 42 inches, with a battery of four converters, 8 by 11 1/2 feet in size. The smelter building will be of steel, 40 by 150 feet.

GILA COUNTY.

Two concentrators will be put in the mill being erected by the Pinto Creek M. & S. Co.

T. Crandall is superintending a group of copper claims on Tonto for the Confederate M. Co.

L. M. Teal is superintending the Pinto Creek M. & S. Co.'s Yo Tambien mine. The concentrating plant will be completed Jan. 15, 1903.

C. M. Clark will push the electrical project for transmission of power from upper Salt river to Globe.

At the Old Dominion, at Globe, it is thought to be the intention of the management to run two furnaces only while utilizing the flue dust, and as soon as this is completed to run one furnace only. The loss in slag with the present smelter is stated to average about 1.72%. This loss may be reduced to 1/2 of 1%.

GRAHAM COUNTY.

The Arizona Copper Co., beginning with Nov. 1, discontinued the custom of work-

ing on Sundays in the mines and works. It is said that the DCM Co. will follow suit.

MARICOPA COUNTY.

Near Wickenburg the Electra mine work is being pushed on the east drift at a depth of 210 feet.

C. Goddard, at Wickenburg, has let a contract for sinking on the Goddard mining group. A ledge of ore 22 feet wide carries an average value of \$4.60 a ton. An ore reduction plant, 500 tons daily capacity, is projected on the Oro Grande, a steel galloways frame to cost \$40,000 and ore bins of 1000 tons capacity.

MOHAVE COUNTY.

Superintendent Guthrie of the Elkhart mines, near chloride, will have the property reopened. He will remodel the mill.

It is locally considered likely that the Leland people will build a railroad from Santa Fe to the mines. Lumber for a big mill is at Mellen, and will be forty stamps capacity. The road will be about 35 miles in length and along easy grades.

D. H. Moffat, who has judgment against the White Hills M. & M. Co. for \$26,000, will have the personal property of the company sold under attachment lien.

Superintendent Stevens of the Gold Road Co. is driving a tunnel to tap the mine at the level of the tram road, which is graded to the mill in the canyon below. The main shaft between the 200 and 300 levels is being cut out to the dimensions of a standard shaft and will be timbered.

On the 300 foot level of the Minnesota Connor a body of gold ore is reported, 1 foot of which runs eight ounces in gold per ton, 5 feet of ore show five and one-half ounces gold per ton, besides silver. On the 400 level stopes 5 feet in width are being opened up.

C. Metcalfe has arranged in Los Angeles for placing his pumice tufa on the market.

SANTA CRUZ COUNTY.

Mrs. Blair and Miss Barney are working the properties of the Viola M. and M. Co., Oro Blanco mining district, and have a 9-foot ledge running \$31.30 in gold, silver and lead.

YAVAPAI COUNTY.

S. P. Hooker, O. F. Woodward, C. N. Keeney of Le Roy, N. Y., will develop the Senate property, adjacent to the Congress.

Jerome expects that the works of the United Verde Copper Co. and its mines will be running full blast in February, 1903.

W. DeWitt, at the Planet Saturn mines, has been running the mill in a test run of 800 tons of ore from those mines in various lots, each lot taken from the different tunnels and drifts of the mine, one lot being taken commencing at the top of the shaft and extending to the bottom, for Eastern people, who have an option on the Planet Saturn and contiguous properties. The main shaft on the property is 1100 feet deep; there is 1000 feet of stopes and drifts; the vein is from 3 to 7 feet wide. The value of the ore is given at from \$18 to \$25 per ton gold. New York and Boston men have an option on the properties, which is said to include the Yarnell. They will put in air compressors and hoists, and later on an 80-stamp mill. The company has ample water to run a 100-stamp mill.

Near Jerome, G. W. Hull is repairing the damage done by the freshet at the Dillon tunnel, and will soon start the machine drills again.

At the Monarch G. M. Co. deep ore bodies are uncovered.

The erection of a smelter at the Iron King is projected by Supt. Giroux.

YUMA COUNTY.

W. J. Dorsey of the Trio M. Co. has bought the Maraquita mine for \$100,000.

J. C. Higley, owner of the North Star group of mines, will work the property this winter. A recent assay ran 15% copper and \$8 gold.

The King of Arizona and Fortuna mines are running full-handed.

CALIFORNIA.

ALAMEDA COUNTY.

An iron and copper smelting plant is projected on Oakland harbor on the Alameda shore of the estuary.

AMADOR COUNTY.

At the Bunker Hill an ore body 25 feet in width is reported in the 1400-foot level; estimated average in value \$6 per ton.

Superintendent G. W. Horn of the Horn mine, Defender district, has tapped the ore body with the tunnel; it is estimated to go \$30 per ton.

The Sargent property has a drift along the ledge at the 200 level to prospect the ore body. The drifting costs \$4 per foot.

Manager W. W. Worthing, Bay State mine, Plymouth, has made final payment on the bond of the Rhetta claim, adjoining the Bay State, of \$10,000. The Bay State has twenty men at work.

CALAVERAS COUNTY.

The Foot & Thompson mine at Rich

Gulch is bonded by the Western M. Co. of Colorado. Kavanaugh & Lewis of Cripple Creek are in charge of the work; eighty tons of machinery for the mine have been shipped to Valley Spring, on the way to the mine, comprising an air compressing plant, pipe, etc.

All the available men in San Andreas are working on the ditch near Calaveritas, which is being cleaned to take water to the gravel deposits at Calaveritas.

KERN COUNTY.

At the Gold Peak group near Bakersfield the Western Exploration Co., has ore in a 3-foot breast, giving \$31 in gold and 100 ounces silver per ton.

MARIPOSA COUNTY.

The Gazette hears that the 40-stamp mill of the Merced G. M. Co. will begin crushing rock from the Mary Harrison on Dec 1.

At the Golden Gate, near Whitlock, Manager W. H. Cavin is taking out ore and will start the 10-stamp mill next month. A new shaft is being sunk on the Imperial by Nevels & Hannah.

MONO COUNTY.

At Bodie the Syndicate mill has been hung up for the winter, all of the leasers' ore being crushed.

NEVADA COUNTY.

The South Idaho M. Co. is putting in hoisting and pumping machinery and will unwater the mine.

Near Washington, Supt. F. Enzensperger says he has a pay shoot 13 feet in width. A 20 stamp mill and steam plant are being installed. He expects to have the stamps dropping Jan. 15th.

The Gold Canyon M. Co., W. Gregory superintendent, has a bond on two claims near Moore's Flat—the Majenta and Santa Monica—and projects a 10-stamp mill.

The first gold taken out of the Houston Hill mine in thirty-two years has been extracted by Cocking & Co. The ore went \$16.80 per ton.

PLUMAS COUNTY.

One hundred and twenty men and twenty-five teams are used on the work of extending the Boca and Loyalton Railway toward Mohawk Valley from Beckwith.

J. Lytle has a derrick to remove large boulders from his river bed claim at the Vance mine, near Cariboo.

The Dunn mine, on the North Fork, is crushing ore that averages \$30 per ton. The owners will run their mill all winter.

A. N. Cameron has men running a tunnel on his gravel claim on Rich gulch.

H. & J. Kelly have finished an 800-foot tunnel and have found pay gravel.

SAN BERNARDINO COUNTY.

In the Old Woman mountains, near Danby, the Mountain Jewel M. Co. plans a 10-stamp mill. The Silver Wave 10-stamp mill is in operation.

E. J. Young, manager Southwest Ore R. & I. Co., in Virginia Dale mining district, will put up a reduction plant.

SAN DIEGO COUNTY.

W. F. Harris of the Home M. & T. M. Co. says men are doing development work with good results; principal values, copper and gold.

SHASTA COUNTY.

The Gold Mountain M. & M. Co. has been organized at Redding to work six mining claims south of the Mount Shasta gold mine. D. N. Honn is the Redding representative.

E. K. Gestford is developing a copper mining property near the Afterthought.

The miners employed in the mine and smelter of the Mountain Copper Co. at Keswick have walked out. Demand was made for recognition of the Miners' Union, which was declined. A complete shut down of all operations has resulted, and the suspension of work is indefinite. It is thought possible that there will be no move made by the company to operate any of the property for a year.

Fourteen men are reported driven from Keswick because of intense feeling against non-union men. The Mountain Copper Co. has discharged all of the machine men, molders and railway employees and several clerks in the company's store. The directors say there will be no compromise; the men are equally firm.

The Texas mine is reported closed. The lime quarries of Holt & Gregg, near Kennet, which furnished the smelter with fluxing rock, are idle.

The working force of the Afterthought mine is being increased.

At Redding has been formed the E. P. Connor Co., which projects a 200-ton smelter on the Sacramento river, 4 miles from Redding.

SISKIYOU COUNTY.

River mining will close on the lower Klamath this month. Near Etna the Dredging Co. is working to get the dam in again that was washed out by the high water of Scott river, near Callahans. The dam was to turn the river into a channel that would not interfere with the work-

ing of the dredge, and must be repaired before work can be resumed.

C. E. Humphrey of Barkhouse, near Walker, on Klamath river, will put a mill on the Commodore mine.

TEHAMA COUNTY.

The Southern Pacific Co. will build another oil tank at Red Bluff. The two tanks they now have there will hold, the small one 1,260,000, the large one 2,310,000 gallons. The third tank will be also of 55,000 barrel capacity, the three affording storage for nearly 6,000,000 gallons.

TRINITY COUNTY.

The Van Matre farm is under bond to W. H. Christie of San Francisco, who contemplates operating mining dredges on the property.

At the Enterprise mine, near Weaver-ville, a larger hoist, boiler and pump are being installed. The mill will be increased to twenty stamps.

TUOLUMNE COUNTY.

(Special Correspondence).—At the Bell mine, Tuttle town, Superintendent W. J. Rule is sending ore to a 5-stamp mill adjoining the Street mill. At the Street mine the mill is running, ore being supplied from the 300 north level.

The Morris Tunnel Co., operating near Sonora, have a new engine, and are pushing work on their crosscut tunnel to tap the Austrian vein. They are in 800 feet and have 200 more to run.

Surveys for a 24,000 H. P. plant, under the management of W. H. Hall, will be resumed next spring, to use the waters of Lake Eleanor, Kibba lake and Cherry valley. Three dam sites have been established, and 6 miles surveyed of the 17, the full length of the projected ditch designed to carry 5000 miners' inches. Two independent plants are planned 8 miles above Carters.

Sonora, Nov. 24.

Near Groveland, at the Mohican, the 5-stamp mill is in operation. At the Melghan mine twenty stamps will be run on ore from the 300 and 400 levels. In the spring forty new stamps may be put in.

Work at the Longfellow goes on under the superintendency of F. H. Partington, who contemplates a 30-stamp mill.

At the Cosmopolite mine Supt. Argall finds that the crosscut is within a short distance of the ledge.

Near Groveland the Sierra G. M. Co. has three claims, the Nona F., Alethean and Even Chance. A double compartment shaft is being sunk.

The Banner says H. J. Dykes is operating the Oakland. The App mill, at Quartz Mountain, is in operation. The 10-stamp mill on the Mapes gravel claims, at Yankee Hill, will operate next week.

T. J. Holmes has bonded the John Royal, near Columbia, and will put in a 10-stamp mill.

E. C. Loftus is reported to be interested in the new company to work the St. Ysabel.

The Birney-Wainwright tunnel on Bald mountain made 98 feet in a month. They expect to reach the ledge in four months.

At the Miner's Dream mine, 8 miles from Carters, Berger Bros. have a stamp mill which is operated by a windmill. There is a feeder which is opened and shut automatically by the mill and the water from a tank is also regulated. The mill runs when there is a fair breeze; so far has crushed about a ton of rock a day. The vein at the mine is small but rich.

The suit over the Niagara mine in the Groveland district between Curley and O'Brien on one side and S. Carlton on the other, was decided by Judge Nicol in favor of the latter, on the second trial. The former partners won the suit on first trial. The case will be appealed. Carlton and witnesses swore that they had located the mine three days before their notices showed and the court took that testimony.

J. Rocco has men at work on the Basin mine near Nashton.

A telephone line will be built from Carters to the Mohican mine, 7 1/2 miles.

Superintendent M. T. Fillmore is putting machinery in the Alta Dina, once known as the Kearsarge, located on top of Yankee hill. A hoist and saw mill is nearly completed and a 10-stamp mill contracted for. The shaft is 120 feet deep. Drifts show the vein, which is incased between granite and slate walls, to be from 20 to 60 feet in width, averaging about \$7 to the ton.

The Golden Gate mine chlorination plant will use oil for fuel.

Near Groveland the Big Casino Co. is operating the Mack mine.

Superintendent F. H. Partington is pushing work at the Longfellow mine.

Manager W. J. Graham at the Mayflower mine has machine drills pushing the tunnel 8 feet per day.

The Big Creek M. Co. of Bangor, Me., owning fifteen claims near Groveland, is developing the property.

COLORADO.

BOULDER COUNTY.

The Longfellow mine at Jamestown reports 30 inches of smelting ore, \$100 a ton. Eldora reports that at the Lady Belle tunnel, on Woodland mountain, is a vein in a winze in their 125-foot bore 20 inches wide, assaying \$118 in gold.

Near Wall Street the Colorado N. G. M. Co. have electric drills. Their main tunnel is in 2150 feet; they have opened several bodies of ore.

Knott & Mitchell have a body of ore in the Montreal which samples \$10. It has an adit tunnel 510 feet on the vein which cuts the shaft at a depth of 250 feet.

G. R. Williamson, owner Yellow Pine group, is working the property. This property is thought to be the richest silver mine in Boulder county.

The Doss mine people have their ore bins full and the breast and back of slope shows bodies of ore.

Following a change in the management of the Tynon mine in Erie, 100 miners employed in the property went on strike. About seventy-five of the strikers were employed on the mine last winter when T. A. Bassett was manager. It had been announced that there would be a change in the management of the mine. On the 21st the men were told that Bassett would be in charge. The men refused to return to work until they were paid for back work.

CHAFFEE COUNTY.

Bismuth is reported discovered by Daniel & Crane between Manoa and Newitt. They say they have a ledge of quartz impregnated throughout and almost uniformly with the metal, the croppings at the surface averaging generally 100 feet wide of sulphide of bismuth. At the Salda smelter is another sample of 150 pounds of bismuth ore from the property of F. F. Clements on Badger creek, who has about 18 inches of bismuth ore that will run high in value.

CLEAR CREEK COUNTY.

The strike of free gold on the Jackson placer continues to improve. J. G. Roberts is sinking a shaft on the new discovery and reports 5 feet of quartz carrying free gold.

New machinery goes on at the Old Stag mine at Freeland.

Control of the Idaho Springs M. & R. mill has passed to B. F. and S. R. Strasser who will put in additional machinery for concentrating and steam power, giving capacity for 100 tons ore per day. J. N. Isgrig of Denver is manager.

Empire district is now sending 700 tons daily to the Golden smelter. The Gold Fissure mine, because of copper in the ore, has a \$4 rate. Some old time mines near Georgetown have also resumed shipments.

Near Freeland, the Freeland Extension mine is putting in a compressor. Manager R. McKenzie has resumed work on the Centurion tunnel.

Mrs. M. A. Allen, former owner Gold Cord stamp mill and concentrating works, is possessed of the property, and will in the future conduct its management.

In the lower tunnel of the Yankee Con. Co., made 1000 feet from the tunnel entrance, a smelting streak of white quartz carrying gold, silver, lead and copper, \$200 to the ton, 9 feet in width, has been found. This vein has 70 inches of smelting ore in addition to mill ore. A winze is being sunk.

Georgetown reports the new power plant at the Wilcox tunnel running satisfactorily; two rounds of shots broke an average of 13 feet. Carson & Heaton have a contract of 1000 feet, and expect to complete it by the middle of April.

The Clear Creek M. & Reduction Co. has made an advance of \$1 a ton in charges for treatment of ore at the Golden smelter. The smelter will pay for copper as usual and make no charge for silica. The Golden plant heretofore has accepted ores carrying a value as low as \$15, but the value is now advanced to \$20.

W. Rogers has a controlling interest in the Baltimore group and an option on the Shively, including right of way through the Bismarck. The tunnel of the Baltimore property will be pushed ahead to cut the Shively Owosco, Kilbride and other lodes.

CUSTER COUNTY.

At Silver Cliff is a great number of location stakes dotting the ground and covering an area of more than 5 square miles. A great number of 10-foot holes are in evidence. The principal locators are Haskell, Jackson and Ferguson. They have fifteen claims. The ore is chalcocite quartz, streaked and incrustated with a black material said to be manganese; about a carload of the rock is piled up ready for shipment. Time and development may demonstrate the existence of pay mineral in the new field; the present does not warrant excitement. The territory has all been taken and shuts out the prospector and the man with only enough

for grub stake. It is only the man with money and nerve that can tackle the proposition.

FREMONT COUNTY.

At Canon City a 100-ton addition will be put in at the Empire smelter. At this plant zinc and lead ores are exclusively treated. No attention is paid to the gold or silver, the silver being saved in the lead, but the gold is not considered as a by-product. The tailings are concentrated several times and the product is zinc.

The new cement mill at Portland, near Florence, was opened this week. The mill cost \$250,000, capacity 1000 barrels of cement per day.

Oil from the Florence field carries 31% illuminating qualities, with a heavy paraffine base.

GILPIN COUNTY.

The Foote & Simmons mine, Gregory district, is to have a plant of machinery and the shaft sunk 400 feet deeper to the 1000-foot point; S. Mellor is manager.

Near Central City the Columbus Con. M. Co. has a number of new ore bodies in the flat formation toward the northern extremity of its territory with average value of \$11 a ton, and is similar to the ore that is supplying the company's cyanide plant at present.

Robert Hastie, manager Viola G. M. & D. Co., operating in Russell gulch, has made a fine record. The company was organized October 9, incorporated the same day. Nine claims were bought and the management began work. Two shafts have been sunk, one 60 feet, which gives returns of \$20 per ton, and another 35 feet in which ore is found, valued at \$15 per ton.

The Pearce mine, in Central City district, has interested English capital and is to be reopened with J. H. Gower as manager. Machinery will be put up and sinking prosecuted.—The Notaway M. Co. will sink a new shaft.

M. P. Dalton of the B. & D. Con. M. & M. Co. is locally credited with having raised a large sum for the larger development of the Gregory-Bobbitt, Fisk, Cook and other properties in the Gregory district, and intention to sink the Cook or cage shaft 200 feet deeper, which will enable them to connect with the deeper workings of the Fisk and Gregory incline.

For the second week in November Central City district's shipments of smelting and crude ores, tailings and concentrates to the smelters and concentrators were seventy-three cars (1460 tons)—a total of 153 cars, or 3060 tons.

Central City reports ninety acres of mineral land, little of which has been worked, sold for \$250,000—the Summit, New York City, Brooklyn Sunset, and fifteen other lodes in Pleasant valley—by the Gilpin County M. & L. Co. to Indiana and Denver men. The new company will be the Sostoria G. M. Co.; general manager, B. N. Meyers of Central City; assistant manager, C. Ekgrig; treasurer, W. S. Strauser, Washington, Ind. The shaft will be retimbered and sunk 500 feet.

The Ingalls G. M. & L. Co. has bought the Straub, Straub Extension, Press and the east 250 feet of the Ashtabula lodes, in Eureka district, for \$10,000. Sinking progresses at the Straub, which is the main working shaft of the group.

The Avon G. M. & M. Co., operating the Avon, on Quartz hill, has the San Juan, and the two are to be worked in conjunction.

W. A. Garrett has bought the Bant lode, in Gregory district, for \$25,000. The shaft is to be timbered and sunk deeper. G. D. Johnstone is in charge.

GUNNISON COUNTY.

L. Cavanagh is appointed receiver for the Forest Hill Con. M. Co. The court orders sale of sufficient of the property to pay the first mortgage bonds of the company now overdue and amounting to \$219,333.33. The property consists of eleven claims in Tin Cup district. The stockholders and bondholders are residents of Pittsburgh, Pa., and Canton, O.

JEFFERSON COUNTY.

The cornerstone of the new Stratton Hall of Metallurgy at the School of Mines at Golden was laid last week with imposing ceremonies. The hall will cost \$55,000 when completed and was named in honor of the late W. S. Stratton of Colorado Springs in recognition of the \$20,000 he gave to the school for the building of an assay building. The money for the construction of the building is furnished by the State.

LAKE COUNTY.

The Ballard mill is designed to treat the low-grade ores of their property by the cyanide process; there are bodies of this siliceous material in the Ballard, the Penn and other mines of that locality which have lain idle for years because the smelter could not handle them. The cyanide plant has a capacity of only sixty tons a

day. This company built a mill near the Arkansas smelter a few years ago, but the talcose character of its ores prevented the cyanide solution from leaching through the mass. Improvements have been made since that time and ways to meet this difficulty have been found.

The pumps at the Keystone shaft, Iowa gulch, are handling 300 gallons of water per minute. In this locality the Reno is carrying on prospecting and development work.

The Yak tunnel is now in the heart of the gold belt, the heading is within about 300 feet of the Ibox line and will be driving in that territory by January 1.

The Sugar Loaf locality shows gains during 1902. The Orinoco, Gunnison, Fanchon and other leases are all taking out some ore. The Bartlett tunnel when completed will open another shipper. This tunnel will also be used for drainage.

Near Leadville the Progressive M. Co. reports a strike of 10 feet of \$50 lead carbonate ore, exposed at a depth of 280 feet. In one day \$500 worth of ore was hoisted to the surface and \$1500 additional broken and ready for hoisting. A new shaft has been started by the Fryer Hill Mines Co. on adjoining ground to catch the same shoot. The ore has been discovered in the new shaft of the Progressive M. Co., on Progressive hill, a low ridge which forms the northern boundary of Big Evans gulch, and is within 1500 to 2000 feet of the bonanza mines of the early days of Fryer hill. The ore is neither a streak nor a pocket, but appears to be a well-defined, continuous body, apparently a continuation of the Fryer hill shoot. The Fryer Hill Mines Co. is sinking a new shaft on the Pride of the West claim, which adjoins the Progressive M. Co.'s property, and is now taking out fine ore from the Tip Top property. A 4-foot streak averages 100 ounces silver. This ore body lies in a lower grade of siliceous material, of flinty character, which will carry an average of 10 ounces silver. In addition to the high-grade siliceous ore now being shipped, a considerable tonnage of iron ore is being moved, and some sulphide. Thirty-five men are working on ore. Manager Newell expects to have 100 men by January 1.

The El Paso's new pump, which handles 1200 gallons of water per minute, is taking care of the flow without trouble. Men are cleaning out the old drifts from the bottom of this shaft. When this is completed mining operations will commence in the old El Paso sulphide drifts.

New machinery is in position on the Harvard shaft, to put it down 1000 feet if necessary, or to reach an ore body.

LARIMER COUNTY.

At Pearl, the Grayton group of mines, formerly owned by C. B. Ayres, has been incorporated as the Grayton Copper Mines Co.

The Grayton group of mines near Pearl have been incorporated as the Grayton Copper M. Co., with headquarters at Denver and Grand Encampment.

LAS ANIMAS COUNTY.

Near Trinidad the fire in the Engleville coal mine is still burning, despite the efforts to smother it. It is feared that the eastern end of the mine will be destroyed. Men are walling up the entries and air courses. J. A. Kehler and C. H. Stevens, general superintendent and general master mechanic, respectively, of the Colorado Fuel & Iron Co., are supervising the work of fighting the fire.

OURAY COUNTY.

The Revenue Tunnel Mines Co. has a shaft sunk from the tunnel to a depth of 870 feet to prove the continuity of the ore measures at a greater depth. Good gold ore was found at the bottom, when the pumping plant got out of order, and the shaft filled with water and was abandoned. The distance from the bottom of this shaft to the surface is 2870 feet. Including the drifts, stopes, shafts, inclines, etc., the underground workings of the property, if strung out, would make a tunnel 35 miles in length. From the portal the tunnel bears in a southwest direction for 1½ mile, where a station is made. From this point its course is changed directly south, and extends a little more than 2 miles farther into the mountain. The Post says the incline from the Ophir tunnel connects with the tunnel on this side at the 2-mile station. The tunnel is double-tracked to this point and is almost large enough for a narrow gauge passenger train. The ore cars are run by an electric motor to the 2-mile station, and beyond that are drawn by mules. It requires 110 cars to convey the ore from the tunnel to the mill, and this number will now be insufficient to carry the increased quantity that comes down through the incline from the Ophir tunnel. The employees ride in and out on these cars going to and from work. E. A. Crisher, the mine superintendent, rides in and out on bicycles, following the trains of cars in or out.

SAGUACHE COUNTY.

A strike is reported on the property of the Hazard G. M. Co., 3 miles north of Crestone.

SAN JUAN COUNTY.

Level No. 7 of the Henrletta mine, Cement creek, Red mountain, is in 1900 feet. Smelting ore in the breast of the tunnel is 5 feet in width. They are drilling it by hand instead of by machine drills. Twenty tons of high-grade smelting ore at a single round of shots are being broken out. All of this ore is piled on the dump at the mouth of the tunnel. This smelting ore is the highest grade yet found in the mine.

Near Silverton, the Contention mill and lower tramway belonging to the Contention M. Co. is transferred to the newly incorporated Black Prince G. M. Co. The Black Prince group is ten claims on Arastra gulch slope, King Solomon mountain, and accessible by easy connection with the Contention tram and thence the mill on the Animas river.

SAN MIGUEL COUNTY.

A. B. Frenzel has thirty men at work on claims carrying vanadium ore, up Leopard creek, above Placerville. It is understood he has a transportation rate of \$15 per ton on the product from Wilson station to Paris, via Galveston. The United States Vanadium Co. has been organized to exploit and operate the property.

Vanadium is reported on Bear creek, 3 miles from Newmire, which is being worked by a company which ships the ore to London for treatment. This company will ship 1000 tons, on which they expect to clear \$15 per ton.

The Silver Pick mine of Mount Wilson, which has lain idle for two years, has mortgaged its property for \$100,000 and will resume operations.

In consequence of the murder of General Manager Collins, the Smuggler-Union M. Co. has closed its mines and mills for an indefinite period. The company employed between 400 and 500 men. Telluride offers a reward of \$10,000 for the arrest and conviction of Mr. Collins' assassin. Governor Orman offers a reward of \$2000.

SUMMIT COUNTY.

New York and Pennsylvania men project a 200-ton concentrating mill and a 500 H. P. electric light and power plant at Argentine, across the range, 12 miles from Georgetown, on a 200-acre tract of land which they own at the forks of Peru and Snake creeks, near Argentine and Montezuma. The mill is primarily for the ores being taken out by the Rothschild M. Co. They project a 1000-foot tunnel into Cooper mountain. The power plant will supply light and power for mines in the locality. They figure on 500 H. P. from the two streams.

Near Kokomo, the Michigan on Sheep mountain is shipping ore. The mine shows iron sulphides. The Breene tunnel expects to ship 150 tons per day. The Kimberley, Wilsey and White Quail are shipping. The Gold Cord tunnel is being worked at the foot of Jack mountain. The Union Con. group on Gold hill will place an electric plant to operate the tunnel.

TELLER COUNTY.

(Special Correspondence).—The St. Patrick G. M. Syndicate, Ltd., have a shaft 700 feet deep with 30 feet pump. Mine has 10x12 steam hoist, air compressor, 250-gallon station pump, 700 feet lift, two 100 H. P. hoisters and fine shaft house. Doing prospecting with diamond drills. They are crosscutting through the formation northwest and southeast, 1200 feet of drilling. Have a vein of low-grade ore. There are several veins known to run through the property, that are opened up in adjoining properties. They are doing some crosscut work from the center to the east and west side lines independent of the low-grade vein. On account of the low grade and having to haul the ore to the railroad it will not pay to ship. Eighteen men employed. Wm. Weston is general manager, A. P. Gallagher, superintendent. Victor, Nov. 20.

(Special Correspondence).—The Par Value G. M. Co., operating the Mary Cashen, Mary Alice, Dillon and a portion of the Monument, are hoisting from the third and fourth levels of the Mary Cashen and doing prospecting on the sixth level; shaft is 4x8 feet 820 feet deep. They are averaging about two and one-half carloads of ore per week. Ore runs two to five ounces in gold. Employing twelve men. Doing development work on the Mary Alice. Ore house at the Mary Cashen holds 300 tons. The mine is equipped with electric hoist. David Heaton is general manager, A. R. Pierce, superintendent. The shaft on the Dead Pine mine is down 700 feet, are sinking 300 feet further; 10x14 hoist, six drill compressor on the property; have an engine on the 600-foot level used for sinking. Forty men are

employed on Dead Pine and fifteen on the Queen, which is operated by the same company. Charles P. Oliver is manager. Victor, Nov. 23.

(Special Correspondence).—The Grace E. Mutual Leasing Co. of Cripple Creek are prospecting on Gold hill on the Progress M. Co.'s Gold King claim. Wilson, Patton Bros. & Lewis, Cripple Creek, are leasing on the Moon Anchor on Gold hill. Working on the third, fourth and sixth levels; working five men; shipping about seventy tons per month; ore averages \$50 per ton. N. S. Wilson is manager of the Moon Anchor, also one of the leasers.

The International mine on Gold hill is taking out ore that runs one and one-half to two ounces in gold from the third and fourth levels; shaft is down 400 feet; have a steam hoist on the mine.

James Ames of Cripple Creek has three claims on Bare hills carrying mica; vein is 8 to 10 feet wide. Books taken from the surface measure 14½x10 inches. He will put in machinery.

Mohrhaecher & Murrell of Cripple Creek have a lease on the Dolphin claim of the Golden Age Co. on Globe hill. The shaft is down 90 feet. They will put on machinery.

The Stratton Cripple Creek M. & Dev. Co., Cripple Creek, are operating the American Eagle, John A. Logan on Bull hill, and the Abe Lincoln and Chicago and Cripple Creek tunnel in Poverty Gulch on Gold hill. The American Eagle is producing 500 tons per month of \$50 ore. The John A. Logan has not been a regular shipper, but is looking better than for some time past; is now shipping four cars per week; averages about \$50 per ton. The Abe Lincoln is shipping four cars per week. The Chicago tunnel is making a good showing and the prospects are good for shipping; have a complete plant of machinery on each property. W. G. Rice is manager.

On Ironclad hill the Ironclad mine have eight men taking out fifty tons per day; ore averages \$12 from the fifth to the seventh levels; a small cyanide plant is on the ground treating the ore; 100-ton plant will go in. The ore they are taking out is the fillings from the old stopes. Cripple Creek, Nov. 23.

A daily output of sixty tons is being made from the Mary McKinney. No attempt is being made to drain the shaft of water below the 500-foot level. Supt. Keener says when the other mining companies are ready to take hold of the water proposition the directors will do their share. Lessees on the Anaconda Co.'s ground are outputting forty tons a day; average grade \$40 a ton.

C. Tillery, former superintendent El Paso Co., has a lease on a block of the El Paso estate, Beacon hill. A. G. Williams, late superintendent the Pinnacle Co., has a lease on a block of that company's ground on Bull hill. New leases on the property of the Gold Sovereign Co. on Bull hill are signed for one year, flat royalty 25%.

Consulting Engineer Bancroft, who has been retained by the administrators of the Stratton estate, is making examination of the different shafts and workings.

The daily production from Stratton's Independence, Ltd., is about 250 tons; average grade about \$25 a ton. A drift is being extended at the 150-foot level on the new ore shoot recently opened up.

In Cripple Creek district many men are doing development and assessment work outside.

Wilson & Co., leasing on the Moon Anchor, will do considerable development work this winter.

J. Wilson, who has a lease on the Thompson shaft of the Elkton Co., is shipping ore.

Stratton's Independence shipment for the week ending October 31 shows an increase in value of \$10,000 over the week preceding, the total production about \$45,000. The largest single day's production was October 27, when the mine produced 295 tons of ore, value \$1400.

On Mineral hill, at the Addie C., Manager J. M. Walsh says he will not cut his first station until he has reached 500 feet. The Laura Lee is being worked by three shifts under the management of C. W. Knox.

The government is making another geological survey of the Cripple Creek district under the direction of R. C. Evans.

Victor reports the Portland's output 250 tons a day. J. F. Burns is confident that the Portland will be opened up bigger than ever. A 100-drill compressor is being installed at shaft No. 2. The production from the mine, when the plant is ready for work, will be 600 tons a day. The greater portion of the ore now being mined is being treated at the company's reduction plant at Colorado City.

Manager Phillips of the Ben Hur announces the suspension of operations upon that property indefinitely. It is probable that a lease will be granted on the ground. It is generally supposed that the ore shoot

from the Midget pitches into Ben Hur ground at a depth of 800 feet. The workings of the company are now within 200 feet of that point.

Manager Rice will put in a 20-drill compressor at the American Eagles mine of the Stratton's Cripple Creek M. & D. Co. on Bull hill to supply air for the American Eagles, the Zenobia and the John A. Logan mines, the supply pipes being connected through the American Eagles. There is a 30-drill compressor on the John A. Logan that has heretofore furnished the air.

The water committee appointed to plan unwatering the Cripple Creek district has decided to adopt the El Paso tunnel, which can be constructed at a cost of between \$80,000 and \$100,000. The plan is to start the tunnel from the lower end of Arequa gulch, on Cripple creek, and run it 1 mile northeast to the El Paso mine, cutting the main water course of the district 1000 feet beyond that property. The tunnel will intersect the El Paso shaft at 600 feet and will drain the country north of there to a depth of 1000 to 2000 feet. Mines like the Blue Bird, on the top of Bull hill, will receive that much benefit, while the Elkton's benefit will be considerably less because of its lower elevation. It is expected to tap the main water course within seven months. It is proposed to work five breasts—one from the portal, two from the El Paso shaft, one north and one south, and two from an intermediate shaft to be sunk from the floor of Arequa gulch. This will make it possible to open the water course in the time specified. The intermediate shaft is an idea evolved at one of the meetings of the water committee.

The Elkton Co. has cut the Thompson vein on the 700. Lessee Wright is working this vein on the upper levels.

The special committee to build the drainage tunnel for the Cripple Creek district report good progress in soliciting funds for the project. All the mines to be benefited are willingly contributing their pro rata share of the working capital, and are putting up the necessary funds. It is conceded that the cost of the enterprise will be about \$80,000. There is some talk of a second and deeper drainage tunnel in the near future to unwater the camp at a depth of at least 3000 feet.

At Cripple Creek the Last Dollar shipped this week 200 tons of ore to the smelter.

The El Paso Con. G. M. Co. is getting out thirty-five tons daily of smelting ore.

The La Montaigne M. & L. Co., on block 8, school section 16, have cut the ore shoot on the 450 level. They have drifted 160 feet on this shoot at the 350-foot level.

A number of new leases on the property of the Gold Sovereign, Bull hill, all to run one year, royalty 25%, have been signed.

A 20-drill compressor is being installed on the American Eagles by the Stratton Cripple Creek M. & D. Co.

The Cripple Creek M. Co., operating the Hull City placer, is locally credited with producing \$100,000 a month.

The Independence Con. Co. receives on an average of 33% net on all shipments. The company took hold of the property two years ago upon terms favorable to the company. The shaft, then at 700 feet, was put down to 1070 feet, and drifts run on the veins showing at that depth. The indebtedness of the company, amounting to about \$60,000, has been wiped out. The mining operations are in charge of R. P. Russell.

On Dec. 13 all the property of the Gold Calf Con. M. Co. is to be sold to satisfy a judgment in the sum of \$362.80, obtained in favor of E. Hartsborn. The property of the company consists of the Gold Calf, survey No. 8845; the Lulu, the 92 No. 2, the Happy Jack and the Little Bertha lodes.

A recent strike on the Gold Sovereign property on Bull hill is pronounced exceedingly rich; the rock that showed no sylvanite or free gold assayed \$1680 per ton. This ore body was opened up in the 600-foot level 100 feet from the shaft. On the west contact of a 4-foot shoot and within a thin setting of green talc was a mass of sylvanite, while on the opposite wall protruding from a brown porphyry was a mass of native gold. Lying on each side are other bodies each nearly as wide with an average value of \$94 40 in gold to the ton. One body is porphyry, the other is phonolite and another is the Fox shoot. The rich ore body has not been proved up as to extent. It may be only a pocket for which that section of Bull hill has been remarkable. A month's development work will prove which.

IDAHO.

IDAHO COUNTY.

Anderson Bros. will put a new roller mill on their mine at Florence.

The Wise Boy mine has started its 10-stamp mill for the winter's run.

Notification has been received from the

Lewiston land office from Commissioner Hermann of the General Land office of the temporary withdrawal of 2,300,000 acres in Idaho and Boise counties, lying south of the present Bitter Root forest reserve, pending an investigation as to the advisability of adding the territory to the reserve. With this addition, the Bitter Root reserve will comprise 5,300,000 acres, or an area as large as the State of Massachusetts.

KOOTENAI COUNTY.

The St. Joe placers have been bought by Pittsburg men.

NEZ PERCES COUNTY.

Near Lewiston, the Eureka M., S. & P. Co., and the Fargo G. & C. M. Co., are developing copper properties on the Snake river. Electric drills are being installed by the Eureka and the Fargo is putting up a reduction plant; seventy-five men are at work. The country rock is diorite; trend of veins northeast, dip slight. The veins are capped with brown hematite iron, carrying \$20. Under the capping are copper pyrites, carrying gold and silver. The Eureka has found ores 10% copper, \$8 gold, five ounces in silver.

OWYHEE COUNTY.

The Sinker Tunnel was begun November 20, 1899, to drain War Eagle mountain, and to determine if the vein continued to the tunnel level, 2300 feet below the old workings. The tunnel site is 3 miles east of Silver City, at an altitude of 5250 feet, and has attained a length of 1½ miles.

Manager W. J. Prisk has made an average of 8 feet per day since the use of machine drills. The tunnel is 7½ feet wide bottom, 7 feet wide top, 7 feet 1½ inch high; inside grade 6 inches to the 100 feet.

SHOSHONE COUNTY.

The St. Joe Basin Placer M. Co. has bought eight claims at the headwaters of the north fork of the St. Joe river for \$95,150. Cash payment of \$2000 has been made. W. T. Hales of Wallace will be manager of the company.

The Record says that near Wallace the tunnel on the Nine Mile is in 1900 feet. Manager Flink will run another 100 feet. The Gold Standard is putting in 500 feet of 18-inch pipe to operate the hydraulic elevator.

The ore shoot in the O. K. mine at Gardner has been exposed for 300 feet. An upraise has been started.

MONTANA.

BEAVERHEAD COUNTY.

Near Wisdom the Bonanza mine's electric machinery is working.

Manager W. B. Stanchfield of the Ajax mine has it in operation. Fifer and Pendleton will work the July Flower this winter.

FERGUS COUNTY.

The Gold Reef M. Co., Gilt Edge district, will put in a roasting furnace.

FLATHEAD COUNTY.

A report on the West Fisher mine, made to the board of directors of the Portage L. & C. D. Co., says: "The ore as now exposed on the property is an ideal one for milling by amalgamation and concentration. If the ore does not change in character, the proper method of treating it is as follows: Crush in stamp mill, with amalgamating plates in battery; run discharge from battery over outside plates and concentrate on Wilfley tables. There is nothing in the ore which interferes with the cyanide process of extraction. This would save freight and smelting charges on concentrates, but would be more expensive than the above method. A mill test made on an average sample from No. 0 tunnel carried \$14 gold. This test showed that 65% of the values were free, while 30% could be saved on the Wilfley tables in high concentrates, leaving a loss of only 5% in the tailings. This test shows a very high saving. The assays were as follows: Head sample, \$14; tailings, after amalgamating, \$5.60; saved by amalgamation, \$8.40; concentrates, after amalgamating eighty tons into one, \$388; tailings, after concentration, 75 cents; saved by concentration, \$4.85. This shows a saving of 95%."

GRANITE COUNTY.

The Phillipsburg Mail hears that the Granite concentrator will be enlarged and that ultimately all of the ore taken from the Granite and Bimetallic mines will be treated at the concentrator and the concentrates shipped to some smelter, until such time when the company can build a smelting plant of its own.

LEWIS AND CLARKE COUNTY.

R. A. Bell, owner of the East Pacific mine, wants plans and estimates for a 50-ton concentrator. He has on the dump at the mine 17,000 tons of ore, all low

grade, the values running from \$7 to \$10. The ore concentrates well.

MADISON COUNTY.

Near Virginia City Manager Millard of the Kennett M. Co. will use the Shafter mill until August 1, 1903, to be fitted with a concentrating plant, to operate all winter on ores of the Kearsarge mine.

MISSOULA COUNTY.

The old Sierra M. Co. has leased the Sierra claims for three years to O. C. Finkelburg for \$20,000.

F. M. Rites has bought the patents of C. M. Allen of Lolo to treat sulphide ores, and will organize a company.

PARK COUNTY.

Livingston reports the intended consolidation of the Bear Gulch M. Co. with the Gold King M. Co.

NEVADA.

ESMERALDA COUNTY.

The Alpine M. Co. has incorporated, owning numerous claims.

EUREKA COUNTY.

M. L. Requa has an option on the Ruth group of mines, near Ely.

LINCOLN COUNTY.

Manager Freudenthal of the Manhattan Co., Pioche, in the Telephone group, traversed by the Raymond-Ely ledge, says he has ore which shows 200 ounces silver, 61% lead and \$3 gold. In the Puritan group, on the original holdings of the Manhattan Co., in the shaft ores yield 71% lead, 133 ounces silver and \$2 gold per ton.

The Keystone mine, Yellow Pine, is turning out ore under the management of C. F. Schader of the German-American Co. I. E. Blake, who promoted the building of the California Eastern Railroad from Goffs to Manvel, was at the head of the Keystone mining enterprise; but, owing to the failure of the railroad and the inability to pay off all the indebtedness, the mine was attached and sold under execution. He was unable to redeem the property and it passed into the hands of the people represented by Mr. Schader.

The mill of the Duplex & Searchlight is crushing thirty tons daily. Water is supplied by an electric pump at the 400 level in the shaft. Manager F. P. Swindler has thirty men at work and is running crosscuts in each direction from the 400 level.

LYON COUNTY.

The North Rapid mine at Como is closed down on account of the inclement weather. A large mill was in course of construction.

NYE COUNTY.

B Cramp of Philadelphia is reported to have bought the old Liberty mine, 25 miles from Tonopah, for \$60,000.

G. F. Hensel of Haverford, Pa., has bought for himself and H. Clothier of Philadelphia the Molly group, near Butler, for \$60,000.

The shaft of the Ohio-Tonopah is down 320 feet.

The Halifax-Tonopah Co. will sink a shaft 600 feet.

The main shaft of the Montana-Tonopah is 310 feet deep and is going down 5 feet per day.

STOREY COUNTY.

At Virginia City the Gold Canyon Tunnel Co. has organized to drain the mines of the Gold Canyon section lying between the Alta at Lower Gold Hill to the Dayton at Silver City. The proposed tunnel will be about 8300 feet long to connect with the south lateral branch of the Suro tunnel at the Alta shaft, all of the water being drained through the old Suro tunnel.

WASHOE COUNTY.

The Con. Nevada M. Co., Wedekind district, is sinking on the Anna Belle. A shaft house will be erected, the present one being used for an ore house.

At Steamboat C. M. Sain has bonded eighty acres—first payment of \$50,000 to be made in six months, \$100 per month paid in advance on the first of every month until the first payment of \$50,000 is made.

NEW MEXICO.

GRANT COUNTY.

The Copper Queen Con. M. Co. of New York has incorporated at Santa Fe; headquarters, Bisbee, Ariz. The company will also have an office at Fierro. C. P. Cramer is agent at that point.

Negotiations are under way for a smelter of 100 tons capacity at Silver City.

The International S. & R. Co. is incorporated; W. H. Miller, L. W. Britting, R. H. Batchelor, M. F. Bollen, Lordsburg, the business to be carried on in Grant county.

SIERRA COUNTY.

The Hillsboro G. M. & M. Co. and the Snake and Opportunity people have consolidated their interests and the two groups will be operated under one management.

The Oliver M. Co. of chloride is receiving mining and mill machinery. The company has power drills and is about to begin a tunnel 1000 feet long.

TAOS COUNTY.

The new smelter of the Fraser Copper Co., Rio Hondo district, is in operation. Manager O. H. Stanley, American Con. M. Co., says he will build a concentrating mill, fifty tons daily capacity.

OREGON.

BAKER COUNTY.

At Prairie City J. W. Bonta and associates of Philadelphia have bought from Cleaver Bros. the Oregon Wonder and Will Cleaver groups, the former consisting of thirty-seven and the latter of twenty-one claims.

At the Payche mine, Greenhorn district, a 20 stamp mill is in operation.

Manager J. M. McPhee of the Golden Wizard, Deer Creek district, will put in a reduction plant, capacity 100 tons a day, and a station pump, capacity 1000 gallons a minute.

JOSEPHINE COUNTY.

Placer mines have water sufficient to start. All expect to get in a longer season of work and get out more gold this season than they have done for many years.

A 4-stamp mill goes in the Kramer quartz mine, Mount Reuben district.

The Rogue River M., M. and D. Co., has incorporated at Grants Pass, J. F. Brennan, L. Brennan and C. Berry.

Los Angeles and Redlands, Cal., men have bought the Dowden gold mine and Braden mill, near Medford, for \$100,000.

PENNSYLVANIA.

SCHUYLKILL COUNTY.

The anthracite coal miners' dispute with the operators, which was made the subject of arbitration, is likely to be settled by the miners securing an increase of 5% wages, a nine-hour day, and yearly agreements between the men and the company which employs them. The arbitration committee will meet again on Dec. 3, when it is expected negotiations will have progressed sufficiently to have the whole matter definitely settled.

SOUTH DAKOTA.

LAWRENCE COUNTY.

During October the Spearfish M. & M. Co. produced \$22,000, with two idle days at the mill, owing to the non-arrival of acid. The Spearfish Co. are still drifting on the ore body on the Johnson gulch side of the property in the direction of the old Black Diamond workings. In the breast of the tunnel the ore body is 10 feet wide and the ore will mill \$7 per ton. The Spearfish Co. can mine and treat ore running as low as \$3 50 per ton.

UTAH.

BEAVER COUNTY.

At the Majestic Manager Farish will sink a main shaft through which the output of the entire group is to be ultimately discharged to a depth of 800 or 1000 feet.

Near Milford, the Wasatch M. Co. has sold their property to Evans & Lathrop of Salt Lake for \$25,000. They have let a contract and crosscutting has begun from the bottom of the main shaft.

EMERY COUNTY.

The Copper Globe M. Co.'s property is now owned by W. R. Pike of St. George. The Copper Globe properties were located in 1899, in a sandstone formation, the richness of some of its surface ores commanding attention. Bodies of low-grade copper ores have been exposed by tunnel workings, but could not be worked on account of lack of transportation facilities.

GRAND COUNTY.

In the La Sal country, near Basin, a St. Louis company, will work the Skylark group. Work starts next week on the Iowa group, Gold hill. The new 100-ton smelter at the Paradox-La Sal mines is ready to blow in.

IRON COUNTY.

At the Ophir Co.'s properties, the cyanide process is being substituted for the Russell lixiviation process. The new plant has twelve tanks, a crushing capacity 150 tons daily. At the Johnny the new mill is being completed and will be ready to receive ore.

JUAB COUNTY.

Near Eureka, the Emerald mine reports pay quartz on the 700-foot level. Ore shipments from the Tintic district

during the week amounted to seventy-seven carloads, divided among the mines as follows: Bullion-Beck, nine; Eagle & Blue Bell, three; Gemini, thirteen; May Day, two; Yankee Con., seven; Uncle Sam, three; Star Con., one; Lower Mammoth, seven; Mammoth, ten; Mordue Iron ore, one; Grand Central, five; Dragon Iron mine, sixteen. The Mammoth mill also shipped two carloads of concentrates.

Noar Tintic Superintendent Williams, Spy mine, is driving a drift from the 700 level to connect with the Ajax tunnel. This will give an outlet for the ore on the other side of the mountain.

The Utah mines at Fish Springs have thirty men at work.

Manager Geddes of the Swansoa, near Silver City, will furnish 2000 tons per month silver-iron ore to the Bingham Con. smelter. The South Swansea will be enabled to resume.

SALT LAKE COUNTY.

The blowing out of the Germania's furnaces causes T. R. Jones, its former manager, to tell the Tribune that that was the first time it had been voluntarily done since they were blown in just thirty years ago by the founders. Since that time he estimates that bullion of the value of nearly \$200,000,000 has been drawn from its furnaces, the greater portion of it produced during his administration as general manager.

W. S. Hall, superintendent of the Copper Belt, tells the Bulletin the road is now hauling about 500 tons of ore daily—300 from the Commercial (Bingham Con.) and 200 from the Columbia and other mines.

Superintendent W. R. Smith of the Highland Boy says the tunnel making for the Leonard vein has less than 50 feet to go, and before the end of November should cut it, at 500 feet vertical depth. The tunnel is following a cross fissure and at contact, according to indications in upper workings, should break into a large ore shoot.

SUMMIT COUNTY.

The Ontario mine of Park City reports a new ore body at a depth of 2000 feet, carrying lead, silver and zinc.

Superintendent Keely will have charge of the Consolidated Silver King extension and Bogan properties at Park City.

Manager Treweek projects continuing the Wabash shaft, Park City, to a depth of 1200 feet.

TOOELE COUNTY.

A gasoline hoisting plant goes to Ophir for the Montana Con. Manager P. Ryan has the shaft down 300 feet and will resume sinking. The company's ground, consisting of sixteen claims, is now all patented.

The cyanide plant, Sunshine M. Co., Camp Floyd district, has been closed down to install a slimes plant. Manager Moore says general repairs and alterations will also be made.

WASHINGTON.

FERRY COUNTY.

At Republic the California w11 be sunk to the 500-foot level. Shipments of two cars a week go to Nelson, averaging \$1500 to the car, about twenty-five tons each.

Four cars of ore were shipped from the Quilp last week, working force twenty-six men. The Great Northern Railroad has completed its spur.

About 200 men are at work in Republic. Of this number, the Quilp has 30, the Morning Glory 6, the Black Tail 10, the Lone Pine-Surprise 10, the Trade Dollar 10, the San Poll 10 and the California 30.

YAKIMA COUNTY.

Work on the shaft of the Elizabeth G. M. Co., Gold Hill, has shut down for the season. A depth of 400 feet was reached.

WYOMING.

CARBON COUNTY.

Saratoga reports 360 mining claims adjoining the Ferris-Haggarty copper mine at Battle Lake, acquired by Salt Lake and Wyoming men for \$150,000. Among the members of the new company are C. D. Clark of Evanston, C. H. Fishback of Rawlins, T. Kearns, J. E. Bamberger, D. Keith, S. Newhouse and W. H. Dickson.

FOREIGN.

BRITISH COLUMBIA.

Near Aspen Grove is Camp Hedley, on Twenty Mile creek, predominating mineral gold. The principal property is the Nickel Plate mine, M. K. Rogers manager. He is erecting a 40-stamp mill. When a railway is built his people will erect a smelter.

J. N. Greenhields, principal shareholder Montreal & Boston Copper Co., owning the Sunset mine and smelter at

Boundary Falls, says the second furnace will be in operation Dec. 15; a third furnace will be built, set up and in operation by Feb. 15, 1903. The power plant at Boundary Falls is being enlarged to give power sufficient for five furnaces, which capacity will be reached.

At Sandon, on the 21st, a representative meeting of the silver-lead miners of East and West Kootenay, resolved that a protecting tariff on imported lead ores, pig lead and its products is desirable, subject to the conditions that it be clearly shown and assurance given that such tariff will be of direct benefit to the silver-lead miner rather than the smelters and refineries only, and recommended that lead bullion smelted and refined or otherwise treated in bond in foreign countries be readmitted to the dominion of Canada upon the payment of an ad valorem duty of 15% of the cost of smelting and refining, corroding or other process of manufacturing.

The Trail smelter deducted 10% from the silver values of the last shipment from the Capella property at New Denver. It is a dry ore, carrying black sulphurets of silver which give high values. This is stated to be the heaviest deduction that has ever been made by any smelter in that country.

The Ymir mine during October ran fifty stamps 29 days 14 hours; estimated profits on operating, \$3000 after deducting \$3082 for development.

Michel announces that the strike of the coal miners of the Crow's Nest Coal Co. at that point has been settled, and that the miners have resumed work.

Wm. Thompson, manager Rossland-Kootenay mines, speaking of cost in British Columbia of mine supplies, says Eastern Canada has been fostered at the benefit of British Columbia, and submits statistics indicating the differences between the prices of mining supplies at Rossland and in the Cœur d'Alenes, which difference is due entirely to the customs duties:

	Wallace, Idaho.	Rossland, B. C.
Wire nails.....	\$3 50	\$4 00
Drill fittings, discount off list.....	20%	None
Air drill hose, per foot	42¢@45c	50¢@60c
Stearic wax candles, per 40 sets.....	4 95	6 00
Triple tape fuse, per case of 6 M feet.....	20 00	28 00
Gutta percha fuse, per case of 6 M feet.....	20 00	28 00
XXXX hasting caps, per 1000.....	6 60	9 00
XXXXXX blasting caps, per 1000.....	8 00	10 00
Atlantic red engine oil, per gallon.....	26	36
15" cold test oil, per gallon.....	21	35
Air cylinders, per gallon.....	33	44
Capital cylinders, per gallon.....	44	52
Dynamite (large consumers)—		
40% per 100 lbs.....	12 20	16 00
60% per 100 lbs.....	15 70	19 00
Dynamite (small consumers)—		
40% per 100 lbs.....	13 00	16 50
60% per 100 lbs.....	17 50	19 50

Mr. Thompson adds, as a result of the tariff on the kind of oil used, the Rossland mines paid 20% to 25% more for the product than did the Cœur d'Alene mines, although the Standard Oil Co. controlled the Canadian supply as effectually as they did the American article. Replying to a query as to the powder supply, he states that it is largely a matter of preference. His miners preferred American powder, claiming that it generated less fumes than the Canadian powder, and he accordingly uses American powder.

In the Similkameen district, at Aspen Grove, the Bates Bros.' claims—the Big Dutchman and the Golden Sovereign groups—have been bought by Terre Haute, Ind., men for \$135,000 cash. The Big Dutchman group has a defined lead carrying copper glauc and native copper. On the Golden Sovereign group, adjoining, native copper has been found. The Aspen Grove camp in the Similkameen mining district, elevation 3500 feet, is on the line of the proposed Canadian Pacific railway extension from Spences bridge to Princeton.

MEXICO.

CHIHUAHUA.

J. R. Roslyn will operate the Santo Domingo placers, Concha river, 80 miles east of the city of Chihuahua, by steam shovel and sluices. He thinks that the dredging methods as used in California would be better; but as the shovel method had been started by former owners and the machinery was on the ground, he has arranged to use it. The city of Chihuahua is the nearest railroad point at present, but the Stitwell road (Kansas City, Mexico & Orient) will go through the property.

DURANGO.

The Guggenheim Exploration Co. have acquired the mines, mineral lands, railroad and smelters at Valardena for a price approximating \$5,000,000. The property has for ten years been operated by E. W. Nash and G. C. Barton. It is reported to be rich in gold, silver, copper and lead. The actual producing mines in operation on the property, it is stated, number about 200. Some of these have been worked for 200 years. The Guggenheim purchase is practically an entire mining camp including the town of Valardena. It has a population of about 50,000 people, all employed by or dependent upon the mines and smelters at that place.

GUANAJUATO.

The La Luz Mines Co. of Denver and Boston own property in Guanajuato mining district and will commence January 1 on its new mill, to be located at the property, to be equipped with forty stamps and have a minimum capacity of 100 tons a day.

MONTEREY.

After having been shut down for a year the Sierra Mojada mining properties, owned by the Guggenheim interests, are to be reopened. A few shipments of ore, taken out before the mines were shut down, have already been made to Monterey, and sufficient to keep a force busy for several weeks is still on the dumps. It is expected that by December 1 the mines again will be in full operation. The mines were purchased by the Guggenheim Exploration Co. eighteen months ago.

SONORA.

The Sonora Quartz M. & D. Co., operating in the District of Altar, have installed a pipe line and pumping station to furnish a water supply to their mines and camp. The plant pumps 100,000 gallons daily.

At Minas Prietas the Grand Central M. Co. is prospecting with a derrick and well drill, intending to sink 1200 feet by that method. If results prove satisfactory, a shaft will be sunk.

During October the manager says the shipments of silver from the mines of the Bufo M., M. & S. Co. aggregated 75,000 ounces. He expects these shipments to continue until the rainy season, next June. The Bufo Co. employs 1500 mules in freighting.

SOUTH AMERICA.

UNITED STATES OF COLOMBIA.

W. H. Ashwell, T. J. Quinn, T. Clinton and S. H. Wright of Detroit have organized the Cauca Valley Con. Mines Co. and are at work on the properties and will have three sets of 3,000,000-gallon pumps. To dig ditches in the country would be expensive and the water rate and undergrowth would make it cost as much annually to keep them open as it would to dig them. At present the natives are mining in a small way, washing out the gold by hand on their claims, and have great difficulty in getting supplies. The placer claims have already paid for the property and the last return was twenty-three pounds of gold.

SPAIN.

The Cerro Murlano chalcocopyrite mines, 10 miles from Cordova, which are being explored by a British company, are found to have been worked out by the Romans to at least 400 feet in depth, in spite of the large quantity of water which had to be raised.

Commercial Paragraphs.

THE National Drill & Mfg. Co., 530 National Life Bldg., Chicago, Ill., have begun the manufacture of mining machinery.

THE B. F. Nell Co., 4013 Wentworth Ave., Chicago, Ill., have begun the manufacture of filter presses for metallurgical and other uses.

THE American Engineering Works are making special rifle screens suitable for placer mining work and would be glad to figure on an extension of this line of work.

THE Link Belt Machinery Co. of Chicago are erecting an extension to their wrought iron and sheet iron department building. It covers 336x125 feet and will give them most advantageous space for manufacture. The company reports having orders for several dredging plants to be used in placer mining in the West.

F. L. BROWN, general manager Pacific Steel & Wire Co., has gone East. The company will establish at Oakland, Cal., a plant for the manufacture of steel and wire specialties. Among its stockholders are D. O. Mills, H. E. Huntington, I. W. Hellman, president of the Nevada National Bank; Ant. Borel of Ant. Borel & Co.; Percy T. Morgan, president of the

California Wine Association; Frank M. Smith, president of the Pacific Coast Borax Co.; Lewis E. Spear, formerly of Lewis Spear Co.; John Rosenfeld Sons' Co., and W. H. Talbot, of Pope & Talbot.

Personal.

H. BLACK is manager Kansas Union M. Co., Empire, Colo.

J. W. BURKE is foreman Spearfish M. Co., Cyanide, S. D.

E. E. BRIGGS is superintendent Mascot mine, Turret, Colo.

F. L. DWIGHT is manager Bisbee West M. Co., Bisbee, Ariz.

J. P. OWEN is manager Sierrita M. & M. Co., Oro Blanco, Ariz.

V. G. HILLS has returned to Cripple Creek from Denver, Colo.

P. SHARPE is manager Santa Cruz G. M. Co., Patagonia, Arizona.

H. D. LEMON is manager North Star mine, Custer, South Dakota.

J. LANE is foreman Olsen mine, 6 miles from Coopertown, Cal.

H. J. BARTON has returned to Oakbar, Cal., from San Francisco.

L. D. SIVYER, M. E., of Spokane, Wash., is in Los Angeles, Cal.

J. S. HURSTE is superintendent Santa Bihiana mine, Sonora, Mexico.

J. F. BURNS has returned to Colorado Springs, Colo., from St. Joe, Mo.

JOHN FILIUS of Shasta county, Cal., has gone to Boston for the winter.

MANAGER J. P. COPPEAU has returned to Iola, Kan., from Salt Lake City, Utah.

C. E. BUNKER has resigned as superintendent Keystone mine, Amador City, Cal.

E. P. ARTHUR, JR., of Cripple Creek, is in Park county, Colo., on mining business.

E. ARKELL of Denver has gone to Reno, Nev., to take charge of the Con. Nevada M. Co.

F. IRWIN succeeds Jas. Hutchinson as manager Trade Dollar Co., Silver City, Idaho.

ROBT. CHRISTIAN succeeds J. McQuillan as superintendent West End mine, Tonopah, Nev.

R. C. FACER, superintendent Camp Opportunity mine, Silver City, Idaho, has gone East.

J. F. CRISMON of the Utah M. Co. at Fish Springs, Utah, has charge of the assay furnaces.

A. CHALMERS is superintendent of the Sultana mine, Angels, Cal., vice C. H. Morgan, resigned.

C. E. HOTALING succeeds E. F. Stuart as master mechanic Trade Dollar mine, Silver City, Idaho.

J. E. BESS succeeds Superintendent Lohnnie at the Maxwell mine, Cracker Creek, Baker county, Or.

C. H. MORGAN has resigned as superintendent Sultana mine, Angels, Cal., and has gone to Lundy, Cal.

J. J. HOBAN, manager the Argus of Idaho Springs, Colo., has gone East to visit relatives and on business.

CURTIS H. LINDLEY has returned to San Francisco from the transaction of legal business in the Coeur d'Alenes.

M. D. THOMAS, former foreman Trinity Copper Co. mine, goes to Bully Hill as foreman of the Bully Hill mines.

R. S. ROSE of Marquette, Mich., is at Pierce, Idaho, examining mining property in the interests of Michigan people.

S. A. PARNALL bought the Americano mine, Terrazas, Chihuahua, Mexico, and will make El Paso, Texas, his home.

B. W. BEGER has resigned the superintendency of the Last Chance mine, Mogollon, N. M., and returns to Denver.

A. HOOVER has resigned from the Santa Rita Con. M. Co., and will be mine superintendent Cumaral mines, Sonora, Mexico.

A. J. PRITCHARD of the Coronation M. Co. of Seattle, Wash., has gone to Coronation Island, Alaska, on company business.

A. B. HAMILTON, manager Ramhler mine, Grand Encampment, Wyo., has returned from a visit to Beaver county, Utah.

P. GINTHER is manager Encinillas mines, operating the Dolores y Anexas mines, 45 miles from Santa Rosalia, Chihuahua, Mexico.

W. S. MANN, formerly superintendent Thayer M. & M. Co., Miramar, Costa Rica, is now assistant superintendent Sheep Creek, Alaska, mines.

C. B. ROGERS is manager of Modoc mine and dry concentrating plant, Las Cruces, N. M., former superintendent Old Dominion mine, Globe, Arizona.

W. H. JACKSON, former superintendent Golconda and Belcher mines, has the same position with the Cracker-Eagle and Cracker-Summit Cos., Sumpter, Or.

R. V. DANIELS, collector of customs Naco, Ariz., has resigned, to devote his time to the business of the Gold Treasure M. Co., of which he is secretary and treasurer.

G. G. VIVIAN has gone to Sultepec, Mexico, to resume management of the Hidalgo M. & S. Co. property, which includes a fifty-ton smelter and silver and lead mines.

W. A. BATEMAN of Calumet, Mich., is in Bisbee, Arizona, to close the deal with G. Baron for the property in Montezuma canyon, Huachuca mountains, Cochise county, Arizona.

P. S. COULDREY will be the manager Le Roi No. 2 Co.'s mines, Rossland, B. C. Mr. Couldrey has had charge of copper mines in Spain and of copper and lead mines in Germany.

W. M. H. WOODWARD of Silver City, New Mexico, has gone to Porto Rico, U. S. A., to examine the mineral possibilities of the island and will establish the first complete assaying and analytical laboratory in Porto Rico.

G. R. ADAMS has resigned the superintendency of the Oquirrh-Bingham Co., Bingham, Utah, and goes to South Africa at a salary of \$2000 a year. H. A. Brown, late of the Creole mine, Park City, Utah, succeeds Mr. Adams.

J. J. MCSORLEY has resigned the superintendency of the What Cheer mine, Calaveras county, Cal., and has gone to Calaveritas, Cal., where he has the management of another mining property. H. J. McSorley succeeds him as superintendent of the What Cheer.

J. L. HARRIS, superintendent Quincy mine, Houghton, Mich., whose resignation was to take effect Dec. 1, goes to New York. Superintendent Robert of the Adventure mine there, who also was to retire Dec. 1, will stay on, as H. A. Allen has reconsidered acceptance of the management of the Adventure. Superintendent Key of the Adventure mill has resigned.

Obituary.

AT Park City, Utah, D. Gillis, the veteran foreman of the Silver King mine, died on the 18th inst. from injuries received while on duty in the mine.

ARTHUR H. COLLINS, general manager Smuggler-Union mine, near Telluride, Colo., was murdered by an assassin on the 21st inst., being shot in the back through a window as he sat in the company's club room. He died on the 22nd. Mr. Collins was president Colorado Mine Owners' and Managers' Association. The assassin has not yet been found.

TITUS MOLITOR, the oldest assayer in the Black Hills, died at Deadwood, S. D., on the 16th inst., aged 68 years. Born in Hungary, he came to the United States in 1859, taking an interest with his brother, J. Molitor, of Molitor & Co., San Francisco, at the time a prominent assaying firm and acting as mint for the United States in the coinage of the \$50 gold slugs. With his brother, S. Molitor, he opened the first assay office in Montana, in 1864, and operated a silver smelter there for a time.

Catalogues Received.

Sixty pages, black and silver binding, with gold sulphurets interspersed throughout the texture thereof, comprise the latest catalogue of Heald's School of Mines and Engineering, 24 Post street, San Francisco, Cal., with good argument for such instruction, illustrations of what students can do, and detailed information as to the school's progress and purpose.

"Underground Wire Rope Haulage" is the title of a treatise on that important subject of interest to mine workers, illustrating the economical application of wire rope haulage to underground work, the engravings adding much to the value of the work. The cuts showing the special arrangement for curves, a horizontal guiding sheave, and the position of the rope with a train approaching, are unique and of special interest. The booklet will be mailed on request by the authors, the Broderick & Bascom Rope Co., 809 N. Main St., St. Louis, Mo., or their Eastern representative, F. Baldwin, 33 South St., New York City, N. Y.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING NOVEMBER 18, 1902.

713,940.—WIRE SPLICING MACHINE—J. Barron, S. F.
713,843.—SALESMAN'S LIFT—C. A. Bouck, Los Angeles, Cal.
713,951.—HYDRANT—C. L. Burkhardt, Dayton, Wash.
713,919.—GRAFTING—J. B. Burrell, Wrights, Cal.
713,950.—GRAFTING—J. B. Burrell, Wrights, Cal.
713,750.—EXCAVATOR—W. Cole, S. F.
714,102.—CLOTHESLINE PROP—S. J. Day, Los Angeles, Cal.
713,623.—CHAIR FOOT REST—J. C. Garrett, S. F.
713,762.—TENNIS SET HOLDER—O. Haskell, San Rafael, Cal.
713,638.—PUZZLE—W. Hepfinger, Montebano, Wash.
713,775.—BOTTLE CONVEYOR—Kuehnrich & Larsen, Los Angeles, Cal.
714,001.—CLOTHES DRIER—F. S. McDougall, Seattle, Wash.
713,902.—OIL BURNER—J. H. Morrissey, S. F.
713,793.—EXPLOSIVE ENGINE—J. A. Ostenberg, San Jose, Cal.
713,799.—POULTRY FOUNTAIN—J. Reed, Berkeley, Cal.
714,038.—PROCESS—J. A. Russell, Tacoma, Wash.
714,016.—AMPERE-HOUR METER—W. A. Sherlock, S. F.
713,719.—HAND TRUCK—W. G. Tower, Corona, Cal.
713,723.—WELL ROPE PROTECTOR—T. R. Vincent, Berkeley, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC POULTRY FOUNTAIN.—No. 713,799. Nov. 18, 1902. J. Reed, Berkeley, Cal. The invention relates to improvements in poultry drinking fountains; and its object is to provide a cheap, simple, indestructible and economically operated device which will automatically fill, cleanse and refill itself and in which the water will always be clear and pure, thereby avoiding to a very great extent disease among the fowl. It consists in the combination in a poultry fountain of horizontally disposed drinking pans pivoted rearward of their center of gravity, said pans having their bottoms inclined upwardly and rearwardly, overflow vents at the back ends of said pans, said pans tilting automatically when the water rises to the level of said vents, water supply means above said pans, a casing inclosing said water supply means and said pans except for a drinking space above said pans forward of their pivots, and projections on the wall of the casing rearward of said drinking space extending downwardly into the pans.

HYDROCARBON BURNERS.—No. 713,902. Nov. 19, 1902. J. H. Morrissey, San Francisco, Cal. This invention consists of a shell or casing inclosing separate and concentric oil and steam passages, pipes entering said passages, a plug movable centrally of said casing, a flanged head on said plug, a cap fitting the discharge end of the casing, said cap and plug movable in relation to each other and to the discharge orifices of the oil and steam passages, whereby the vapor supply to the furnace is regulated, and a central air passage through said plug, whereby a current of air may be fed to the casing and steam. It also comprises a novel means for combining the burner with a furnace and regulating the feed of hot and cold air drafts and other details of construction.

Latest Market Reports.

SAN FRANCISCO, Nov. 26, 1902.

METALS.

SILVER.—Per oz., Troy; London, 22½d (standard ounce, 925 fine); New York, bar silver, 47½c, refined (1000 fine); San Francisco, 47½c; Mexican dollars, 38½c San Francisco, 37½c New York.

At these figures \$2 66 Mexican silver is required to buy one American gold dollar.

The Mexican Government has advices regarding the adoption of a gold standard from Europe and the United States. The effect of the continued decline in the price of silver upon the currency of the Philippine has led to the opinion that Congress at its next session should provide a currency of stability for the islands. Financiers are asking: "What is going to happen, not only to the silver countries, but to others in which silver is largely used as a circulating medium, if the price of silver continues to decline?"

China has to collect the indemnity from subjects in silver, trade it for gold, pay exchange and then pay another brokerage to get silver back. Every time China pays a part of the indemnity she slices off part of herself. The result may be that, long before the indemnity is paid, China will be either bankrupt or must repudiate. It is thought that the steady decline in the price of silver will have no material effect on the financial situation in the United States.

COPPER.—New York: Standard, \$10.50@10.75; Lake, 1 to 3 casks, \$11.55; carload lots, \$11.35; Electrolytic, 1 to 3

casks, \$11.35; carload lots, \$11.20; Casting, 1 to 3 casks, \$11.35; carload lots, \$11.00. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £50 is 3d spot per ton.

Advance sheets from Stevens' Copper Handbook for 1902, which will be out in January, show that the production of copper has been materially decreased in countries outside of the United States, Canada and Mexico. The production in Spain and Portugal is not materially affected, as the mines which have been closed down were mostly small ones. The German production shows only a slight decrease, but in Chili, Australia, Tasmania and other important copper fields many mines have been compelled to cease operations on account of the low price of copper now prevailing.

The production in the United States, Canada and Mexico, however, shows a decided increase, and the handbook estimates that the world's output will show an increase of about 40,000 tons, or about 8%. This is slightly under the normal rate of increase for a number of years past.

The increase in Canadian production is from the group of mines in British Columbia and the Boundary Creek districts, including the Granby, the Montreal & Boston and the British Columbia mines. The Boundary Creek district produced 99,730 tons of ore in 1900, 369,618 tons in 1901 and up to Nov. 1 this year 410,894 tons. The Granby mine has increased its output over last year by about 28,000 tons, the British Columbia by 12,000 tons, and the Montreal & Boston increased production is about 1500%.

The large increase in the Mexican production is due to the Greene Consolidated mine.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 13s 1d per ton.

SPELTER.—New York, \$5.25; St. Louis, \$4.50; London, £19 7s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$24.50; San Francisco, ton lots, 28c; 500 lbs., 28c; 200 lbs., 28½c; less, 29c; bar tin, \$ 1b, 32½c. London, £112 spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Francisco, local, \$46.00 per flask of 76½ lbs.; Denver, \$49.50. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½c pure ingots, 35c; No. 2, 90½c, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 18½c; San Francisco, Plumbers', 100-lb. lots, 15½c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$24.00; gray forge, \$21.15; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$28 and \$30.00; open hearth billets, \$31 and \$34.00; San Francisco, bar, 7c to 12c per lb.

The Tread-Kill Cinder Car.

There is in use at the Youngstown, Ohio, works of the National Steel Co. a new design of cinder car which was built by M. H. Treadwell & Co., 95-97 Liberty street, New York, at their Lebanon, Pa., works. This car is used for conveying molten cinder from blast furnaces to the dump. The object of the construction of this car is to enable the ladle to turn on its axis by the use of intermeshing gears. The racking device can be operated by one man. The ladle, when full, can be turned on its axis to either side and dumped so as to empty its contents clear of the track in two minutes. The general design is intended to reduce to a minimum the possibility of dismemberment of the parts, due to shocks received in coupling, or unavoidable collisions. The steel underframes or connecting girders, which connect the end frames on each truck, serve to make the body of the car one continuous member, eliminating or distributing the disproportionate strains.

The illustration shows the car with the ladle in an upright position when full of cinder or when empty after contents are dumped. The operating device consists of a cut wrought iron worm running in cut cast steel worm wheel. The operator revolves the hand wheel on its shaft. This shaft has the driving pinion attached; this pinion meshes in the spur gear on the end of the worm shaft, which in turn drives the worm wheel, which is keyed to the ladle bale concentric with the rolls on its ends. This movement tips the ladle and at the same time causes it to travel sidewise, so that the contents when dumped entirely clears the ties. To prevent the ladle from getting out of alignment a rack is attached to each side of each runway, and gear segments, which mesh with these racks, are keyed securely to the rolls.

The most radical departure is found in the fact that none of the parts are of special construction, and all are interchangeable. The car is equipped with diamond trucks, standard chilled cast iron wheels on steel axles, brass wedges, car boxes, springs, etc., also steel truck bolsters and automatic couplers, allowing substitution of any ordinary standard articles of this class. The ladle is of

The Tread-Kill Cinder Car, Showing Ladle in Upright Position.

standard size, constructed of heavy plate steel and provided with cast iron lining. The height and length of the car are practically standard with those now in use. The actual weight of this car is 60,000 pounds, its capacity being 200 cubic feet, or sixteen tons of molten cinder.

Box Electric Rock Drill.

In the Box electric rock drill, herewith illustrated, the mechanism is simple and designed to be effective. It will be noted that there is one single crankshaft with a gear on one end and a pinion on the other. The gear is driven by the pinion on the armature shaft of the motor. The crank imparts motion by means of a connecting rod to the crosshead. The crosshead is a hollow plug moving back and forth in one end of the cylindrical interior of the drill casing. The crosshead is connected by a spring to a solid plug in the cylindrical interior, which plug follows the motion of the crosshead through a longer range, with the expressed intent that what is accomplished

by a heavy mass moving at a comparatively low velocity in some other drills shall be accomplished in this drill by a slight mass moving at a high velocity, with attendant advantages of light moving parts, small power expenditure, little jar or shock, and minimum wear.

The pinion at the end of the crankshaft drives the chuck through a set of gears, and as the gears are proportioned for a power ratio of about 100 to 1 the twisting force at the chuck is manifestly great.

In Fig. 2 can be seen the steel tube which is placed over the drill and through the shell of which tube the water is supplied. The tube holder, plainly seen in this figure, serves also to effect the water connection with the water supply. By this water tube scheme an intense and concentrated washing action is designed to be produced to drive everything before it and out of the drill hole, the tube also to act as a guide to the drill steel. The method of holding the drill steel in the chuck is noted in Fig. 3. The drill steel has a notch cut in the side, and when the steel is inserted in the round hole of the chuck the chuck

block, seen raised in the illustration, with hand pin left sticking in it, is dropped into the notch. The steel is thus held loosely, the same as in hand drilling. The drill is made and supplied by the Denver Engineering Works of Denver, Colo., who say that it has been under continuous observation in their shops for two years and was afterwards subjected to tests under practical working conditions in the mines wherein existed the hardest kind of rock, and one most difficult to drill, with excellent results.

THE index to the contents of this paper for each volume is also a good index to the kind of people who read it — intelligent, practical, progressive, and possessed of money to buy what they see advertised therein.

Subscribers and Advertisers.

In complimentary reference to this paper by regular readers and subscribers it is not uncommon to have it said in such letter that the writer thereof reads all the advertisements with interest and pleasure. Doubtless, too, with profit, for it is a fact not grasped by all readers that the advertisements are of equal importance in point of educational value with the other contents of each issue. Particularly is this so in the case of the MINING AND SCIENTIFIC PRESS, as the announcements of none but the best in their line appear therein.

With all due recognition of the importance and value of the practical articles enumerated in the issue of Nov. 22 as having appeared herein, specially written for this paper by the men who did the things they talked of, it may be said that many other "articles" written and published in each issue, viz: the advertisements, are equally valuable to the progressive miner or metallurgist or industrial worker. For these advertisements weekly appearing are the records of all mining and scientific progress. They tell in brief business shape of the latest and greatest achievements and advances in the arts of engineering, mining and metallurgy. The illustrated appliances with their brief reference and description give the latest and best news to the reader who can understand it. It is the experience of many a mining man that the first he heard of or knew concerning some labor-saving device or valuable invention was when he saw it in our advertising columns, which are first and foremost in telling about what is latest and newest, enabling the worker to do what is to be done with less cost or in a newer way.

Thus it is that the advertisements are "news" in the highest and best sense, telling their readers of improvements, new machines, economical methods, later styles and better devices.

It may also be said with manifest propriety that every reader of this paper will consult his own interests in buying what he may need from those whose advertisements he reads herein, for a variety of reasons. It is only the enterprising and go-ahead who advertise; they manifestly have the best, for if their non-advertising competitors had as good they would advertise too. This is as a matter of business. As a matter of reciprocity and self interest it is also the province of each reader to patronize in all ways those whose advertisements he sees, for the excellent reason that it is those advertisers who make it possible for the publisher to furnish so much in the way of reading matter fifty-two times a year postpaid for \$3. It is a patent fact that it is the money paid to the publisher by the advertisers that enables him to

weekly produce so expensive a publication, for no matter how large the circulation of such a paper may be, were the publisher obliged to solely depend upon subscription receipts and sales at the news stands, he could not make expenses. Hence as it is the advertisers that make it possible for our readers to weekly get so much for so small a price, it is but business reciprocity to buy from them.

Absorption of Public Lands.

Not since 1889 has there been such wide absorption of the public timber lands of this west half of America as has gone on in 1902. So great is the number of entries, and so widespread the evidence that the spirit of the law is being violated, that the Commissioner of the General Land Office has recommended the repeal or amendment of the law for the sale of timber and stone lands which was passed in June, 1878, and applied to the public land of Oregon, Washington, California and Nevada. In August, 1892, its provisions were extended to all the public land States. The area that may lawfully be taken under that Act by one person is limited to 160 acres. The land must be valuable chiefly for its timber (or stone), and unfit for cultivation if the timber were removed. Every entryman at the time of applying for timber land must make sworn statement as follows:

I have personally examined said land, and from my personal knowledge state that said land is unfit for cultivation, and valuable chiefly for its timber; that it is uninhabited; that it contains no mining or other improvements, nor, as I verily believe, any valuable deposit of gold, silver, cinnabar, copper, or coal; that I have made no other application under said Acts; that I do not apply to purchase the land above described on speculation, but in good faith to appropriate it to my own exclusive use and benefit, and that I have not, directly or indirectly, made any agreement or contract, in any way or manner, with any person or persons whomsoever, by which the title I may acquire from the Government of the United States may inure in whole or in part to the benefit of any person except myself.

After publication of notice for sixty days the entryman must appear with his proof either at the land office or before the county clerk nearest the land, or a near-by commissioner. There he is examined on oath and swears to a long list of answers touching the character of the land and his qualifications for taking title. Among the questions propounded is the following:

Have you sold or transferred your claim to this land since making your sworn statement, or have you directly or indirectly made any agreement or contract, in any way or manner, with any person whomsoever, by which the title you may acquire from the Government of the United States may inure, in whole or in part, to the benefit of any person except yourself?

At the foot of this deposition is a note reading as follows:

Every person swearing falsely to the above deposition is guilty of perjury, and will be punished as provided by law for such offense. In addition thereto the money that may be paid for the land is forfeited, and all conveyances of the land, or of any right, title or claim thereto, are absolutely null and void as against the United States.

Next below this comes the certificate of the examining officer in this form:

I certify that I have tested the accuracy of affiant's information and the bona fides of this entry by a close and sufficient oral cross-examination of the claimant and his witnesses, directed to ascertain whether the entry is made in good faith for the appropriation of the land to the entryman's own use, and not for sale or speculation, and whether he has conveyed the land or his right thereto, or agreed to make any such conveyance, or whether he has directly or indirectly entered into any contract or agreement in any manner with any person or persons whomsoever by which the title that may be acquired by the entry shall inure, in whole or in part, to the benefit of any person or persons except himself, and am satisfied from such examination that the entry is made in good faith for entryman's own exclusive use, and not for sale or speculation, nor in the interest nor for the benefit of any other person or persons, firm or corporation.

The officer before whom the testimony is taken is required to call the attention of witnesses to the following section of the United States statutes:

Section 5392. Every person who, having taken an oath before a competent tribunal, officer or person, in any case in which a law of the United States authorizes an oath to be administered, that he shall testify, declare, depose or certify truly, or that any written testimony, declaration, deposition or certificate by him subscribed is true, willfully and contrary to such oath states and subscribes any material matter which he does not believe to be true, is guilty of perjury, and shall be punished by a fine of not more than \$2000, and by imprisonment at hard labor, not more than five years, and shall, moreover, thereafter be incapable of giving testimony in any court of the United States until such time as the judgment against him is reversed.

From this it is manifest to any one that taking

timber land for the express purpose of selling to some individual or corporation on an understanding previously arrived at is illegal.

Another less common illegal procedure is taking of timber land under the representation that it is mineral or agricultural. Entrymen are permitted to denude the land of its timber and then clear out long before the time for final proof arrives. In some parts of the West the matter assumes the dimensions of a public scandal. The matter is here noted as it tends to illegally curtail the fast-diminishing area of mineral land and deters the prospector and miner.

"Professional Etiquette."

Some weeks ago editorial reference was made to the rising dignity and importance of the engineer, whether civil, military, mining, electrical or mechanical, the profession now being as clearly defined as in the case of law or medicine. In this regard is noted the fact that it is not considered "good form" for a doctor or a lawyer to "advertise," though we never yet knew a doctor of medicine or a lawyer who objected to mention of his name in connection with a case in which he was employed, such mention being gilt-edge "advertising."

It appears that our English brethren of the engineering persuasion consider that, inasmuch as engineering is now beginning to be recognized as one of the learned professions, the professional etiquette that rules for doctors and lawyers must be observed in the case of engineers, and that a consulting engineer must not advertise nor solicit clients. The worthy Council of the Institution of Electrical Engineers of London has promulgated a code of etiquette by which the conduct of its members is to be governed. This code of procedure requires that:

"No consulting engineer should solicit employment as consulting engineer verbally, by letter, by agent paid by commission or otherwise, or by any other means.

"No consulting engineer should answer advertisements for consulting engineers.

"No consulting engineer should advertise for employment.

"No consulting engineer should pay by commission or otherwise any one who introduces clients.

"No consulting engineer should receive trade or other discount, or surreptitious commissions or allowances in connection with any works which he superintends.

"A consulting engineer who is also directly or indirectly interested in any contracting or manufacturing business should inform his client in writing what his connection is with such contractor."

In the abstract this is to be partially commended and endorsed. It puts the profession upon a high plane and is dignified even if conservative. Whether it would be entirely satisfactory in this land of strenuous competition is, however, questionable. It might be well enough for an eminent engineer who has won distinction, and who has deserved reputation enabling him to choose from a mass of clients petitioning him for his services, but to the rank and file of the engineers of the country it seems somewhat rigid and hidebound.

Probably the English Council did not desire to be as rigid as on the surface would seem in its code, but desired to delicately draw a line beyond which zealous members of the profession might hesitate to go. It is not well to cast aside all professional dignity and put in low competition bids for work that demands a high degree of engineering skill, for as long as that is done, the standing of the engineer as a professional man will not rapidly advance in public estimation.

"I've made a success of everything else I ever undertook. Why shouldn't I make a success of this mine?" thinks the successful merchant or business man, and straightway proceeds to manage his mine purchase himself. Just pride in business achievements is commendable and a man has a right to feel confident and self-reliant because he has all his life grasped the right idea, and successfully solved difficult business propositions. But the business man embarking in mining may, upon reflection, or after a little experience, see that the assistance of some one who knows something of mining is a necessary factor in profitable mining. He wouldn't trust a miner to manage the business that he has built up; nor should he place in charge of a mine a man who, however clever in his own line, knows nothing of mining.

Concentrates.

GASOLINE ENGINES are in operation in Colorado at an altitude of 11,000 feet.

A 1 INCH Manila rope at a uniform speed of 80 feet per minute can transmit 15 H. P.

A 30,000-POUND GOLD DREDGER, daily capacity 1000 cubic yards, would require a 25 H. P. motor.

THE field notes as described in patent govern the metes and bounds of the patented property.

INDIA RUBBER and linseed oil are two substances for which no successful substitutes have been found.

A CASTING alloy of lead, 75 parts; antimony, 16.7 parts; bismuth, 8.3 parts, will expand when cooling.

CANDLE WICK dyed blue or green or some other distinctive color is one way of preventing theft of candles.

SO FAR as known the smelter company at Quartzville, Arizona, has no plant, and faith without works is dead.

THERE is no lode mine in Colorado below an altitude of 7500 feet; there are few in California above that altitude.

A **BRITISH COLUMBIA** mining claim is 1500x1500 feet, bounded by vertical side planes; no extralateral rights.

ONE pound avoirdupois as compared with troy weight is one pound, two ounces, eleven pennyweights, sixteen grains.

THE ninetenth and last dividend of the Eureka Con. M. Co. of Eureka, Nev., was paid Jan. 5, 1892, 25 cents per share.

THE average life of punched tin screens in a stamp battery is about twelve days; where the tin is burned off, fifteen days.

OF the silver production of the United States in 1900, 59.8% was from lead bullion, 21.8% from copper bullion, 27.4% from silver ores.

TO CURE rubber belt slipping boiled linseed oil and a little chalk sparingly sprinkled is effective. The belts should not be greased.

LEAD mined and smelted in Canada and refined abroad is now readmitted into Canada by payment of duty only upon the cost of refining.

THE highest London quotation for silver since 1850 was in 1864—62½d per ounce, British standard, 925 fine = \$1.40 per ounce, 1000 fine.

A CONDENSING engine will require from twenty to twenty-five gallons water to condense the steam evaporated from one gallon of water.

AMALGAM plates are sweated by continuous pouring of boiling water over them; but that is advisable only when permanent shut down is intended.

ONE AND ONE-HALF INCH lead pipe will weigh five pounds three ounces to the foot; 2½-inch lead pipe, ten pounds; 3-inch, eleven pounds ten ounces; 3½-inch, fifteen pounds.

CALIFORNIA produced 8,742,500 barrels oil in 1901 and consumed 6,000,000 barrels. The 1902 production will be about 12,000,000 barrels, and the consumption, approximately, 9,000,000 barrels.

THE hydraulic gradient of any stream is due to the volume of water discharged and the physical character of the country traversed, as to erosion, modified by its transverse cross-section and regimen.

FLOURING, or sickening of quicksilver, can be corrected by adding minute quantities of sodium and stirring. When the mercury is foul or greasy or dirty, it can, however, be best cleaned by retorting.

TO FIND the velocity in feet per minute necessary to discharge a given volume of water in a given time, multiply the number of cubic feet of water by 144, and divide the product by the area of pipe in inches.

A GRAIN = 0.0648 gram; an ounce, avoirdupois, = 28.3495 grams; an ounce, troy, = 31.103 grams. A gram is 15.432 grains. The assay ton contains 29.166 grams. There are 29.166 milligrams in one assay ton; 2000 pounds is to one assay ton as one ounce troy is to one milligram.

GLASS is a fine flux for cyanide slimes either in plumbago or clay-lined crucibles. One hundred pounds roasted (not acid treated) slimes, fifty pounds ground white glass, fifty pounds borax, make up the right proportion, and in a clay-lined pot treated in a quick furnace will give gold 860 fine.

CONCRETE mortar blocks are in increasing use by stamp mill builders, and where the cement is properly mixed and set that material has manifest merit. Iron mortar blocks are now being tried with some degree of success. In the use of iron mortar blocks they rest on broad concrete foundations.

CEMENT foundations have been used in California and elsewhere for the mortars of stamp batteries, and cement piles are in use in England. At Southampton, England, cement piles 45 feet long and 14 inches square have been driven by an ordinary pile driver striking a blow with a 6000-pound hammer, as foundation for a warehouse.

In an approximate way the value of a gold specimen in quartz can be estimated by a calculation based on the relative densities: divide the specific gravity of gold by that of quartz, and also by that of the specimen; from the greater quotient subtract the lesser; the remainder

is the proportion of gold; from the lesser subtract 1. The remainder is the proportion of quartz.

AN appeal can be made from any decision or ruling of any local land registrar or receiver to the Commissioner of the General Land Office within thirty days from its announcement. It may be either printed or written and must go through the local land office. A further appeal can be taken from the Commissioner of the General Land Office to the Secretary of the Interior.

THE theoretical miner without practical knowledge is in the same position as the practical miner without theoretical knowledge in so far as that they would be better off if they had both. Usually practical, experienced men make the best theorists, as they have something to start on, or from; they know when a theory is needed and what the purpose is that the theory is meant to fit.

THERE is no ton in troy weight; there is no such thing as a metal weight of twelve ounces to represent the pound troy. True, twelve troy ounces make a pound troy, but there is no such material, existing unit of measurement. A man with "five pounds of gold" has sixty ounces troy. But where gold is bought and sold as are other commodities he will look in vain for a "pound troy weight." It goes by ounces.

THE side lines of a mining claim become end lines when the claim is located crosswise of the vein, necessitating construction of the true side lines with reference to the ascertained course of the vein—parallel with and not to exceed more than 300 feet on each side of its center. In case the originally marked width is more than 300 feet the excess must be excluded, bringing the middle of the vein in the center of the location. Such discarded area is subject to other location.

A 5-STAMP mill, 900-pound stamps, 9-inch lift, ninety drops to the minute, would require 12.272 H. P. The formula is: Multiply weight of one stamp by number of stamps you propose using; multiply that by the height of lift in feet per minute, and that product by the number of lifts per minute; add one-third for friction; divide by 33,000, the quotient is required number horse power. Example: $900 \times 5 = 4500 \times \frac{1}{4} = 3375 \times 90 = 303,750 + \frac{1}{3}$ of 303,750 = 405,000 ÷ 33,000 = 12.272 H. P.

TO GIVE any estimate of the cost per ton of stoping ore must necessarily be approximate. So many conditions govern the cost of such work, and these conditions may be so different in different localities. It has been calculated in ordinarily favorable conditions, that where the ore streak was 4 inches thick the cost of stoping per ton was \$17.33; where 6 inches thick, \$11.55 per ton; 8 inches, \$8.67; 10 inches, \$6.93; 12 inches, \$5.78; 14 inches, \$4.95; but these figures are not claimed to be at all exact, merely indicating in a general way.

IF a bar for a tension test is reduced to a smaller cross-section by cutting out a curve surface for only a short distance as compared with its transverse dimensions, the bar will show a greater unit breaking stress, as the metal does not flow freely and lateral contraction of area is hindered. But, if the portion of reduced cross-section joins the rest of the bar by a shoulder, the apparent strength is reduced, owing to a concentration of stress on the particles at the corner, where the unit stress suddenly changes from the smaller value on the larger section to the greater unit stress on the smaller cross-section.

A CORD of wood weighing 4000 pounds, suitably treated, may be made to yield 2650 pounds pyroligneous acid and 700 pounds charcoal. The 2650 pounds pyroligneous acid is susceptible of production of nine gallons 82% crude wood alcohol, 200 pounds acetate of lime, twenty-five gallons of tar, and about thirty-five bushels charcoal. In the dense smoke per ton of soft coal burned are 10 to 12 pounds soot, 10% to 15% ash, and about 2% moisture. Where fuel is burned in an atmosphere of oxygen no smoke is produced. Where there are no hydrocarbons no fuel will produce smoke in any atmosphere.

THE Tamarack Mining Company at Calumet, Michigan, in connection with the preservation of its maps, has a photograph gallery with every appliance necessary for taking photographs 20 inches by 24 inches. At the end of each month the maps are brought up to date and photographs taken of them. This method gives maps of a size that may be easily handled or sent through the mails, and easier studied than larger mine-maps. A full set of such photographs also furnishes exact records of the condition of the mine. Any one who has had to write a mining report knows the difficulty of preparing a description, which of necessity must be more or less technical, so that it will be intelligible to the non-technical person for whom it is frequently intended. The best solution of the difficulty is through the use of illustrations. This can be done in two ways—by photographing, and by sketches. The former has the advantage of absolute truth, but the latter can bring out many important features that the camera fails to do, such as the structural character of the vein or of the country-rock.

UNDER ordinary conditions, iron melting in a cupola takes up sulphur from the fuel. The greater the percentage of fuel, and the greater the percentage of sulphur in the fuel, the greater will be the amount of sulphur absorbed by the molten iron. The ratio between the total amount of sulphur present in the fuel and the amount absorbed by the iron is dependent upon three conditions: First, the kind and quality of flux used; second, the temperature of the iron; and third, the com-

position of the coke and iron. A proper quantity of flux in a hot working cupola will take care of a considerable amount of sulphur. The sulphur present in the fuel as a sulphuretted hydro-carbon has no appreciable effect in increasing the percentage of sulphur in the melted iron. This accounts for the fact that many foundries melting with coal obtain castings with a lower percentage of sulphur in proportion to the amount of sulphur in the fuel than do foundries melting with coke. The greater the amount of manganese in the iron, the less sulphur will the iron absorb; and it is possible in cases of very high manganese iron for that iron to lose sulphur in melting, the sulphur passing off as manganese sulphide with the slag.

ELECTROLYSIS is the name given to the mechanical process which consists in the dissolution of chemical compound by the passage of an electric current through such compound. As applied to waterworks this takes place in the passage of the electric current from water pipe into the soil. The soil contains salts in solution. These salts vary in their character, but they nearly always contain sodium chloride from the street washings. There is a certain amount of refuse necessarily on the street at all times, necessitating the subsoll, being highly saturated with salts in solution, and the pipes are buried in the soil. These salts are decomposed by the passage of the current from the pipe into and through the soil, and the acid constituent of that process of decomposition attacks the iron, or the lead or the copper, as the case may be, of the pipe. The metal passes into solution, leaving in place of the metal, in the case of cast-iron pipe, a carbon in the form of graphite, which is not soluble in the ordinary acids or salts. This process is continuous, and does continue in proportion to the amount of current which leaves the pipe, until the pipe is so injured that the pressure of the water in the pipe causes it to burst.

IN the Silesian process for treatment of zinc ores there is required about twelve tons of coal to produce one ton of zinc, the labor costing at the rate of about \$15 per ton of zinc extracted. The Silesian furnace is simple in construction, being in the form of a flat arch, lined with firebrick, and bound together with iron rods. At each side of the furnace chamber are six or more alcoves or recesses, separated from one another by a slab of firebrick, but open on the side next the fire. In front of each recess is a door opening towards the outside of the furnace, and securely luted with fireclay when the furnace is in use. At the rear end of the furnace is an opening into the flue or chimney, while below the furnace are compartments corresponding to each recess above, in which the tubes from the retorts terminate. The earthenware retorts have long tubes or nozzles attached to the front of each, and bending down to the compartments below the furnace where dishes are placed to receive the zinc that is distilled from the ore. Either blende or calamine may be treated in these furnaces, and the danger of loss of zinc is slight. The ordinary charge for a twelve-retort furnace is about 700 pounds of calcined ore and 400 pounds of coal, to which is added 100 pounds of dross skimmed from the zinc obtained in previous meltings. The retorts are filled and the refuse extracted from the outside, and a furnace can be kept in uninterrupted operation for a year without repairs. Zinc ore containing silver and lead can be treated in the Silesian furnaces.

IN the process of extraction of gold from its ores by potassium cyanide, the gold is usually precipitated by means of zinc, but it sometimes occurs when zinc is used that the solution is too alkaline or too acid, resulting in the formation of zinc salts. The advantages of electrical preparation are that the preparation is as good in weak solution as in strong ores and however acid the solution may be the gold precipitates. The advantage of being able to use very weak solutions is great, as not only is there a less consumption of cyanide but a weak solution, say five parts in 10,000, can be used for treating cupriferous ores which would destroy stronger solutions. Zinc alone will not always precipitate gold from a very weak solution, and the advantage of electrical precipitation in some cases is manifest. The cathode upon which the gold deposits itself is made of lead sheets fastened in light wooden frames and connected with the negative pole of a dynamo. The anodes are made of iron. The current required is about .06 ampere per square foot. With cathodes 1½ foot apart a force of seven volts is sufficient. In the manufacture of aluminum from hauxite, an oxide of aluminum, the ore is heated in an electrical furnace. The furnace is made of firebrick, and originally the carbons were placed in firebrick lutes but the heat was found to be so great that they melted. The sides of the furnace were, in a later process, coated with carbon but the carbon became converted by the heat into graphite and conducted electricity so that the walls of the furnace were fused. Finally the difficulty was overcome by coating the carbon with lime which prevented the formation of graphite. The hauxite is placed in the furnace and carbon thrown over it. An iron plate is luted on over the furnace. The carbon poles are separated and an electric arc formed. The electro-motive force used is sixty volts, and the current 5000 amperes. Many devices have been introduced for condensing the fumes which arise from the smelting of lead. An electrical method has been recently proposed in which the fumes are led from the furnace through flues, and the fine particles of metal suspended in the fumes collected by means of a discharge of high potential electricity from metal points situated in the flue.

Steel vs. Timber in Mine Shafts.

The relative value of steel for lining shafts instead of timbering has been the subject of frequent notice and discussion, and while, as a general rule, the abundance of timber in most mining regions in the United States makes the subject one of secondary importance, yet the growing scarcity of timber in some few sections lends a little interest to the subject.

The latest practical paper on the relative use and value of steel or timber for shaft lining is by F. Drake, who, at a recent meeting of the Lake Superior Mining Institute, described the use of steel and its cost as compared with timber, citing as example B shaft of the Pioneer mine at Ely, Minn., 862 feet deep, lined with steel.

The article is condensed in the Engineering News.

The shaft dips at an angle of 70°, and contains two 6x6-foot hoisting compartments and one 5x6-foot ladder and pipe compartment. The sets consist of 30-pound T-rails for the hanging wall and foot wall plates; the end pieces and one of the dividing pieces are 25-pound rails, the dividing piece between the skip compartments being a 7½-pound I-beam. The various members of the set are connected with pieces of 3½-inch angle iron, 3½ inches long, riveted with two ½-inch rivets in each leg. The saddles or pieces extending longitudinally between adjoining sets are of 16-pound rail, each 4 feet long.

The lagging in the upper part of the shaft where rock is firm consists merely of lines of old wire rope stretched longitudinally about 5 inches apart, so as to prevent the falling of large pieces of rock. In the softer ground the ordinary 2-inch wooden planks were used for lagging. Since this use of wood materially lessens the safety of the shaft against fire, it is proposed to introduce four sections (4 feet long) of corrugated steel for lagging to every 100 feet of shaft.

The weight of the steel lining is supported at intervals of 60 feet by bearers, four 30-pound rails being used at each set so supported, the ends of these rails resting in cast iron chairs placed in the hitches cut in the solid rock.

The rails for the 5-ton skips are 30-pound rails, with 20 or 25-pound rails for the back runners to prevent jumping the track.

The important question of costs is answered in detail:

COST OF STEEL LINING FOR B SHAFT.

Material for Sets.		
2 18-ft. wall plates.....	360 lbs. @ \$0.0171	\$6.15
2 6-ft. end pieces.....	100 lbs. @ .0189	1.89
1 6-ft. dividing piece.....	50 lbs. @ .0189	.95
1 6-ft. dividing piece.....	45 lbs. @ .0224	1.00
8 4-ft. saddles.....	163 lbs. @ .198	3.22
8 connecting angles.....	26 lbs. @ .035	.91
4 4-ft. back rails.....	134 lbs. @ .189	2.53
6 brackets for back rails.....	45 lbs. @ .022	.99
Rivets.....	10 lbs. @ .038	.38

Cost of material per set.....	\$18.02
Cost of material per foot of shaft.....	4.50

Labor on Sets.		
11 hours laying out and drilling*.....	@ \$0.223	\$2.41
12.4 hours riveting sets and cutting slots in saddles, including handling.....	@ .211	2.60
0.6 hour transporting from shop to shaft.....	@ .213	.14

Cost of labor per set (933 pounds).....	\$5.15
Cost of labor per foot of shaft.....	1.29

*Includes all incidental handling of material.

Bearers and Chairs.		
4 11-ft. pieces.....	450 lbs. @ \$0.171	\$7.69
8 cast chairs.....	128 lbs. @ .04	5.12
8 cast chairs.....	288 lbs. @ .04	11.52

Cost of materials for set of bearers.....	\$24.33
Cost of labor, cutting and handling.....	.30
Cost of bearers and chairs per foot of shaft (bearers 60 feet c. to c.).....	.41

Hangers.		
30 pounds refined iron.....	@ \$0.026	\$0.78
1.67 hour labor forging a hanger.....	@ .211	.36
0.40 hour labor tapping and threading.....	@ .225	.09

Cost of one hanger.....	\$1.23
Cost of hangers per foot of shaft.....	.23

Lagging.		
Material for one set wood lath:		
468 ft., B.M., 2-inch plank.....	@ \$14.00	\$6.61
4 ft., B.M., 2x4-inch x 6 feet.....		
8% waste.....		.53
2 U-bolts.....	7 lbs. @ .05	.35

Cost for lagging.....	\$7.49
Labor cutting plank.....	1.00

Cost per set of wood lath.....	\$8.49
Cost per foot of shaft.....	2.12

Material for One Set Metal Lath.		
222 sq. ft. No. 16 galvanized corrugated steel.....	\$22.64	
5% waste and fitting.....	1.13	

Cost per set.....	\$23.17
Cost per foot of shaft.....	5.94

Since there were 16 feet of metal lath to every 84 feet of wood lath, the average cost per foot of shaft

for wood and metal lath was \$2.73. This, summed up, shows:

COST PER FOOT OF SHAFT LINING.
(Exclusive of skip rails, and exclusive of labor of putting lining in shaft)

Cost of steel sets.....	\$5.79
Cost of bearers and chairs.....	.41
Cost of hangers.....	.23
Cost of wooden lath.....	2.12

Cost per foot, with wood lath only.....	\$8.55
Add if steel, 16 feet to every 84 feet of wood lath used.....	.61

Cost per foot with wood and steel lath..... \$9.16

N. B.—Most of the sets were riveted with a pneumatic bammer, but a few were done by hand. The slotting of saddles was done by hand, but if some power appliance had been used this item could have been reduced 50 cents per set, or 12½ cents per foot of shaft.

In contrast and connection with the above is given the estimated cost of a wood lining for B shaft. This estimate is for sets of 10x10-inch timbers in sets 5 feet c. to c., and does not include the cost of labor in placing the lining in the shaft nor the cost of skip rails:

Materials of Set.		
2 wall plates, 10"x10"x20', 334 ft., B.M. @ \$16.50	\$5.51	
2 end pieces, 10"x10"x 8', 133 ft., B.M. @ 14.50	1.93	
2 dividing pieces, 6"x10"x 4', 60 ft., B.M. @ 14.00	.84	
2 saddles, 8"x 8"x 4', 168 ft., B.M. @ 14.00	2.35	
4 b'k runners, 6"x 8"x 5', 80 ft., B.M. @ 14.00	1.12	
20-ft. strap iron, ½x2½ ins.....	83½ lbs. @ .0235	1.96
Bolts.....	6½ lbs. @ .03	.19

Total for 775 ft., B.M. and iron in a set.....	\$13.90
Labor framing a set.....	1.60

Cost per set.....	\$15.50
Cost per foot of shaft.....	3.10

Bearers.		
4 pieces, 10"x14"x12', 560 ft., B.M. @ \$17.50	\$9.80	
Cost per ft. of shaft if bearers are 60 ft. apart.....	.17	

Hangers.		
15 lbs. ¾-in. round iron @ \$0.04.....	\$0.60	
Cost per foot of shaft.....	.11	

Lagging per Set.		
2-in. plank lath, 682 ft., B.M. @ \$14.....	\$9.54	
9% waste.....	.86	

Total.....	\$10.40
Labor cutting lath.....	1.36

Cost per set.....	\$11.76
Cost per foot of shaft.....	2.35
Total cost of materials and framing wooden lining per foot of shaft.....	5.73

The above shows that the cost of wood lining at the unit prices given is \$2.82 to \$3.43 less per foot of shaft than where steel lining is used. This is made up by the less excavation necessary where steel lining is used.

The author of the paper goes on to give the cost of sinking in two shafts sunk at the same time in the same formation. One shaft was, however, sunk by day labor; the other by contract. B shaft required about 23% less excavation than No. 2 shaft, this being due to the saving in space effected by use of steel.

	Shaft	
	No. 1—Pioneer Mine.	No. 2—Savoy Mine.
Dip.....	70°	83½°
Material of sets.....	Steel.	Wood.
Material of lagging.....	Part wire rope & part wood.	Wood.
Size of timbers of sets.....		10x12 ins.
Compartments.....	(2) 6x6 ft. & (1) 5x6 ft.	(2) 6x6 ft. & (1) 4½x6 ft.
Outside shaft dimensions.....	6½x18 ft.	7½x20 ft.
Outside area.....	117 sq. ft.	153 sq. ft.
Rock excavated per ft. of shaft.....	4½ cu. yds.	5½ cu. yds.
Progress per working day.....	1.43 ft.	1.54 ft.

Items of Cost per Foot.		
	B shaft. (Steel.)	No. 2 shaft. (Wood.)
1. Contract price of excavation.....	\$15.95	\$22.60
2. Company labor act of excavation.....	5.74	1.45

Timber and laths for sets.....		.63
Mining timber.....	1.87	1.15
Iron and steel.....	1.52	1.10
Steel rail.....	4.70	.37
Wire rope for lining.....	.37	

Total, influenced by kind of lining.....	\$35.78	\$36.20
Other items not influenced by kind of lining:		

6. Miscellaneous labor regularly employed*.....	\$10.71	\$8.19
7. Pipe and fittings.....	1.17	.88
8. Miscellaneous supplies.....	4.68	2.81
9. Fuel.....	4.30	2.93
10. Air.....	2.89	1.33
11. Temporary surface buildings and head frame.....	.28	.58

Grand total.....	\$59.81	\$52.92
------------------	---------	---------

*Engineers, firemen, landers, etc.

N. B.—Fuel and air items were roughly estimated, and are subject to much uncertainty.

Mr. Drake's comparative figures favor steel, though some of the items and details would not fairly apply to exact comparative tests concerning the economy of the two. The paper is here given place as presenting the latest and in some ways the best data on the question of comparative costs. Of course, as to durability, the advantage in the Lake Superior region would be greatly in favor of the steel.

Gold and Silver as Compared With Other Mineral Products.

Some recent comparison was made between the value of the gold and silver products of the United States and value of other groups of our mineral products as set forth by the United States Geological Survey in "Mineral Resources of the United States" for the calendar year 1900. The annual volume for 1901, just issued, permits a similar comparison for last year.

In round numbers the value of the gold product was \$78,000,000, and of the silver product the value was \$71,000,000 as money (coining value) and \$33,000,000 as metal (commercial value). As metals, then, gold and silver products were valued at a little less than \$112,000,000; as money they were worth \$150,000,000. The corresponding figures for 1900 were \$115,000,000 and \$153,000,000—a loss for 1901 of over \$3,000,000.

The copper produced in 1901 was valued at \$87,000,000; the lead was valued, as in 1900, at \$23,000,000, and zinc was produced to the value of over \$11,000,000. The copper, lead and zinc products in 1901 were worth \$9,000,000 more as metals than our gold and silver were worth as metals, although the value of the copper product was \$11,000,000 less than in 1900.

The combined values of abrasive materials, of chemical materials, of pigments, and of other miscellaneous minerals, amounting to about \$38,000,000 in 1901, show that they were worth almost half as much as the gold produced, and about \$5,000,000 more than silver as a metal.

The structural materials produced in 1901, the building stone, the clay products, the cements, valued at about \$182,000,000, exceeded the gold and silver by \$70,000,000, if the commercial or metal value of silver is taken, and by \$32,000,000 if silver is taken at its coining value.

Iron ore and its products, the metallic basis of our civilization, increased notably in quantity, but decreased in still greater proportions in value in 1901 as compared with 1900. Yet, notwithstanding a loss of nearly \$18,000,000 in value as compared with 1900, the pig iron produced in 1901 exceeded the metal value of the gold and silver by \$130,000,000, and their combined coining value by \$95,000,000.

Compared with the mineral fuels—coal, petroleum and natural gas—produced in 1901, the combined coining value of the gold and silver is exceeded by \$292,000,000, and the combined metallic value is as \$112,000,000 to \$442,000,000, an excess of \$330,000,000 of the necessary fuels over the precious metals.

The Setting of a Boiler.

The setting of a steam boiler is a most important operation and should always be given the most careful attention, and due consideration should also be given to the possibilities of the future. Particularly is this true about mines, where the excavation of large areas beneath the surface causes an unequal subsidence of the ground, resulting in a change of position of all the buildings and machinery which have been placed on the area of disturbance.

The fact that a boiler has been set in a certain position in a more or less poorly lighted and inconvenient corner is often taken as a final solution of the steam problem, being given but little further attention than to keep fuel under it in sufficient quantities to get the required pressure. To think that it is possible for the boiler to change its position does not seem to occur to those in charge. It would probably be vigorously disputed that such a thing could happen, but the recent explosion of a well-kept and carefully-fired boiler in Detroit is a striking example of the fact that boilers do change their bearings, if not their position.

It is a common practice to set boilers on brick-work, as was done in the case noted, the boiler in this case having three lugs to sustain the weight. It is given as the opinion of the inspector who saw the wreck, that one of the forward bearings had settled, allowing the greater part of the weight to settle on the middle lug, with the result of rupturing the plate by the excessive strain.

As a matter of fact, it is always a bad plan to place stationary machinery on the side of a vein where the subsidence due to underground work is likely to occur.

SOMETHING new in rock drilling for deep holes is reported from Frankfort, Germany, where Howarth and Walski have a device for utilizing the flushing water instead of the boring rod to convey motive power to the borer, the boring being done by a hydraulic motor attached to the bottom of the rods, water under pressure being forced through the hollow rod to the motor, the escaping water doing the flushing. The engineers mentioned say that with a drive pipe and piston 2 inches in diameter and a working pressure of 170 pounds, the test motor gave twelve strokes per second, consuming 1.1 gallon of water, and that the 8-inch bit drilled through hard sandstone at the rate of 26 inches per hour; in soft sandstone at the rate of 23 feet per hour.

Low-Grade Gravel Property.

Written for the MINING AND SCIENTIFIC PRESS.

Under the title, "Hydraulic Mining in Low-Grade Gravels," the MINING AND SCIENTIFIC PRESS of Nov. 16, 1901, published an interesting study of results obtained by working such deposits. Guided by that

even in favorable seasons, never yielded over 450,000 miners' inches. More recently, however, by advantageous reconstruction, this has been increased until from 650,000 to 750,000 inches are obtained, according to the winter. This big supply of water—a daily average of 3000 inches during eight months—can not be utilized constantly with profit in only one spot. For good work it is necessary to have several points

tion to be worked with profit. In fact, twice during the season the water was turned out of this mine altogether, preferring to suspend there than to work it improperly. Later results have justified this course by amply counterbalancing the losses due to suspension. What I shall say in regard to expenses may be taken as applying to both mines, though the results in the second are not so satisfactory as in the first; yet to obtain an impartial average I have included both in the tables that follow.

The geology of these placer deposits furnish material for an interesting study. In my opinion, the formations may be divided as belonging to two distinct periods—the first marked by the existence of a lake and the second by the filling up of the lake. Both of these consist of gold-bearing gravels, with material of every size from pebbles to boulders of 2 and 3 cubic yards in volume, and requiring water, powder and the derrick for their removal. To handle these latter the mine is well equipped. The bank is broken by four giants: one on the front with a head of 400 feet and nozzle 7 to 9 inches, according to circumstances; two on the left side with 150-foot to 250-foot heads; and one on the right with 500-foot head, to break the cement.

My plan of working is the result of long and careful observations and may be condensed to the following statement: "Run heavy and keep the sluice clean." Although this is not very easy, I have succeeded with it and ascertained to my own satisfaction that it gives good results. The deposit fills a gulch whose sides are inclined at an angle of about 30°. On the left the bedrock is a hard, even diorite, and on the right the blue clay rests on a decomposed, pulverized granite. The gravels vary in thickness from 2 feet to 250 feet, bearing gold throughout.

Broken by the side giants, the bank is prevented from sliding too far by the front giant. (I have seen the bank slide ahead as much as 100 feet in twenty-four hours.)

The bank being for the most part loose, this sliding is of course induced by the piping. For this reason the entrance of the sluice is kept at a safe distance—usually about 150 feet away—and the front giant always settled at the head of the sluice.

The sluice is 6 feet wide by 4½ feet deep, with the boxes 12 feet long. At the beginning of the last mining season I had down fifty-six boxes, and at the end of the run 118, of which additional number fourteen were at the head and forty-eight at the lower end. The grade is 8 inches to the box (12 feet). The bottom is laid with blocks in the first ten boxes and boulders in the others. Two undercurrents collect the fine gold very satisfactorily.

I termed it "low-grade" gravel because numerous panning tests during the season showed an average of from 4 to 6 cents per cubic yard. (These tests do not include the prospects which induced the company to buy the property.) Despite this small percentage, I have been able to reach some satisfactory results. To show this in figures, the following table is prepared, and, for the sake of comparison, the results of several years are embodied there; also, the last season, being the only one coming under the present management. I have referred the total amount of expenses and returns to the miners' inch:

COST AND RETURNS PER MINERS' INCH.								
	1895.	1896.	1897.	1898.	1899.	1900 9 Mo.	1900- 1901.	1901- 1902.
Cost	\$0.136	.106	.095	.1004	.866	.0081	0.0855	.08219
Returns.	0.136	.125	.136	.103	.100	.0738	0.0663	.1418
Cost per \$1 Ex'd.	1.000	.850	.705	.972	.862	.924	1.289	.5822

The volume of gravel washed out is not very easy to get at, because for over half a mile in length the outside lines of the bank are changing continually. Without entering into any hair-splitting mathematics, however, I have estimated that between 2½ and 3 cubic yards are moved per miners' inch of water used. By an approximate triangulation of the area worked over in former years, I find that during last winter about two and a half times as much gravel was moved as in any previous season. No changes in the character of the bedrock have been encountered.

In order to obtain these results, I have practiced the following:

- 1. Increase of pressure on the giants.
- 2. Heavy run in the sluices.
- 3. Increase of responsibilities and, consequently, of some salaries.
- 4. Decreasing number of laborers by using more water power.
- 5. Three times a week a careful inspection of flumes, pipe lines, sluices, derricks, etc.

The distribution of the gold, as caught in the sluice boxes, is as follows:

	Boxes.	Per Cent.
First section	15	73.5
Second section	30	13.4
Third and fourth sections	71	1.6
Undercurrent		11.5

From this it is evident that a long sluice is unnecessary, the coarse gold always stopping in the first

Fig. 1—Ground Plan of California Hydraulic Mine.

Fig. 2—Section of California Hydraulic Gravel Mine.

article, I present the following experiences for further consideration and for the encouragement of the owners of such placers.

The property to be described is in California, and some considerable capital has been expended there for the bringing in of water, as well as on the purchase price of the ground itself. The water is conducted to the mine by flume and ditch a total distance of 30 miles, having a capacity of 3000 miners' inches. The nature of the ground through which the ditch is cut, the steep slope of the hillsides and the severity of the winters cause the expense of maintenance to be rather high, aggregating about 22% of the total exploitation expenses. During the earlier years of the company's existence their water right,

of attack, thus allowing changes of water, moving of machines, clean up and other contingencies to be overcome without complete suspension of operations. The water supplied last season was used in the following way:

First mine.....	82%
Second mine.....	13%
Electric lights, derrick, irrigation	5%

This unequal distribution between the two mines is one of intention, and due to the nature of the bank to be washed. The first is of loose gravel with slides and cracks for over one-half mile. Here our efforts have been concentrated, as the other place is characterized by a hard cement, requiring a special installa-

boxes and the fines being caught in the under-current.

To show the exact proportion of all expenses during the running year, the following table has been prepared:

CLASSIFICATION OF EXPENSES PER MINERS' INCH.

Piping and sluicing.....	\$0.01224	15%
Lengthening sluice.....	0.00073	
Moving machinery.....	0.00045	
Moving derricks.....	0.00071	
Moving boulders.....	0.01285	16%
Cleaning up.....	0.00065	
Electric lights.....	0.00134	
Blacksmithing.....	0.00136	
Carpentering.....	0.00187	
General repairs.....	0.00507	
Lumber and powder.....	0.00668	
General supplies.....	0.00422	
Ditch, maintenance.....	0.01534	22%
“ supplies.....	0.00247	
Reservoir.....	0.00110	
Stable and teams.....	0.00110	
Taxes.....	0.00422	
General expenses.....	0.00979	12%
Total.....	\$0.08219	

From this it is observed that 50% of the total expenses is made up of the following: Ditch, 22%; sluicing and piping, 15%; general repairs, 12%.

The author of the article published Nov. 16, 1901, said the results were not very satisfactory to the stockholders—who, by the way, are usually hard to satisfy. My experience shows that low-grade placers can be worked with some profit; but it requires very close attention to the details, for the wasting of the smallest fraction of a cent per miners' inch of water used may imperil the future welfare of the mine.

The accompanying maps or diagrams of the ground discussed may aid in the above.

Cheap Power for Mining.

Herewith is illustrated a 75 H. P. crude oil gas engine furnished the Vandalia mine, El Dorado county, Cal., by the Daniel Best Manufacturing Co., San

Double Cylinder 75 H. P. Crude Oil Engine; Size of Cylinder, 13x18 Inch Stroke; Compressed Air Self-Starter; Oil Consumption, 1-8 Gal. per H. P. per Hour, Working up to Capacity.

Leandro, Cal. The engraving shows the position of the crude oil gas generators where attached to the engine—the two square receptacles in the front of engines as shown—as well as the friction clutch pulley and levers on one engine, and which are the same on the other engine, in so far as the levers are concerned. The engine has two cylinders 13 inches diameter and 18 inches stroke, crankshaft 4½ inches diameter, both cranks set same way and counterbalanced; has two flywheels and gives impulse every revolution; has an attachment for self-starting operated by compressed air. The ignition is produced when first starting up with a battery, and when under way the battery is switched off and a sparking dynamo afterwards furnishes the ignition for the explosive mixture, which is also furnished with the engine. It requires one-eighth of a gallon of Coalinga crude oil to produce 1 H. P. per hour. Weight of engine complete is estimated at ten tons. Floor space required is 10x11 feet.

This engine is essentially the same in construction as all of the crude oil gas engines supplied by the Best Manufacturing Co., except that it is of greater power than others they have had previously, and indicates to them that it is practical to operate any size engine desired on crude oil. They are of the opinion that the larger sizes give better results than the smaller sizes and use less gas (to a certain limit) per horse power produced.

Speaking of the engine herewith shown, W. C. Ralston, at a recent meeting of the executive committee of the California Miners' Association, said: "I recently visited the Vandalia mine, El Dorado county. I found that with a 75 H. P. engine they were using Coalinga oil, distilling the oil and using the gas to run a gas engine, and their cost for the last five months has been from 17 cents to 20 cents an hour for 75 H. P. That is \$1.80 a month per

horse power. Free water power can not heat that. I thought our power at the Melones mine, Calaveras county, Cal., was pretty cheap. We have the Stanislaus river and it costs us nothing but the maintenance of the flume; but, taking the cost of the dam, the cost of the flume, the cost of maintenance and charge off to depreciation, and we can not provide power for \$1.80 per month. And there is a plant there that was a revelation to me in regard to cyaniding the raw ore. They have 470-ton tanks and in forty-eight hours they are extracting 85% to 90%. They are getting the cost down there to nearly \$1 per ton."

The Thermo Hyperphoric Process.*

By A. T. FIRTH.

The following is an account of the thermo hyperphoric process, for the treatment of heavy complex sulphide ores containing large quantities of galena and zinc blende, iron and copper sulphides, and more or less gold, antimony and manganese oxide with traces of tellurium and free sulphur.

This ore can neither be treated by cyanide, chlorination nor by direct concentration after an oxidizing roast. In the latter method only 22.7% of the gold was saved. The above ore, which was from the Tui mine, near Aroha, N. Z., was dealt with by the thermo hyperphoric process with highly satisfactory results during 1900. The process is as follows:

The ore was first passed through a rock-breaker and elevated to the top of the roasting and reducing furnace, which was entirely heated by crude coal gas. The dimensions of the furnace were 25 feet long by 12x12 feet, containing four rows of four muffles, each 13 feet long, the ore first entering through the top of each of the first row of muffles, when it was raked back until the floors were covered evenly to a depth of about 4 inches.

The reducing gas (water gas), which consists of a mixture of carbonic oxide and hydrogen, was then introduced through the back of each muffle, and passed over and through the red-hot ore. After one hour's treatment in the first muffle, it was raked back, and fell through an opening into the next muffle beneath, and again evenly spread, undergoing a similar process as in the first. This was continued down to the fourth muffle, the ore remaining one hour in each, or in all undergoing four hours reducing roast. It was then raked out and fed into the mill while red-hot and wet crushed, the sudden chilling of the ore increasing the reducing efficiency of the mill.

The ore was crushed to forty-mesh and passed over Frue vanners, the resulting concentrates representing 20% of the total weight of the ore, and contained 1.85 ounce gold and 17.24 ounces silver per ton and about 54% of lead, the remainder being made up of iron, silica and copper, with traces of zinc and antimony.

The ore before treatment averaged .425 ounce gold per ton, thus showing a saving of 87.06% of the gold value. The concentrates were then fluxed and smelted, and the resulting lead bullion bought by the Australian Smelting Co. and the various metals extracted and refined.

On account of decreasing value of the ore, this plant was closed down in the latter end of 1900. The total cost of treatment of ore did not exceed \$4.60.

*Journal Chemical and Metallurgical Society of South Africa.

WHEN cleaning out a steam boiler, lighting the interior is important. Open lamps in a boiler are a danger, in consequence of the little room to move about and the risk of setting clothes on fire. Easily inflammable lamps, such as kerosene or gasoline, are liable to explode, and the explosion of a lamp in a boiler is more serious than elsewhere, for it is harder to get away from it. The common oil lamp, by its production of smoke, soon makes the interior of a boiler unendurable. An electric lamp has been designed for the interior of a boiler which can be adapted wherever an electric lighting system is in use. An ordinary incandescent bulb is attached to an insulated, flexible conductor of sufficient length to use it in any part of the boiler. The conductor is attached to the lighting system in the usual way. As there is nothing on the inside of a boiler to hang a lamp on, the bulb is fixed on an electromagnet, so that it can be stuck upon any part of the ironwork. The incandescent bulb is covered with wire work to prevent it being broken.

A 16 AND 12x18 COMPRESSOR, if in good condition, should be capable of operating three 2½-inch drills or two 3½-inch drills with eighty pounds air pressure. A 6 and 6x6 air compressor is not large enough to run any drill, as the capacity would be only about 25 cubic feet of free air per minute. This calculation is based on the three 2½-inch drills using 260 cubic feet of free air per minute, or two 3½-inch drills using 252 cubic feet of free air per minute. To calculate the free air capacity of the compressor, multiply the effective area of the air piston in square feet by the piston speed in feet per minute, which in this case is about 270, based on a speed of 120 revolutions per minute.

An Economical Mining Method Required.

TO THE EDITOR:—I have made especial note that on every opportune occasion you emphasize the benefits to be derived from a mutual intercourse concerning any innovation of method or successful system as introduced in progressive mining.

I have recently become identified with a proposition wherein none of the systems of which I have had a practical experience, nor any of the special methods as described by interesting contributors in the various mining journals from time to time, will apply, and if any party can offer a good solution for the cheapest route from stope to rock breaker, I am sure such information will be valuable to others who, in company with myself, are striving to "round corners and polish ragged edges."

The property in question is a low-grade silver-lead mine, with a mill capacity of 200 tons daily. The values are found in the walls to a large extent, the veins proper being generally simply talc streaks. The pay rock will vary from 4 to 25 feet in width, the average being 8 feet. The waste and ore is so intermingled that the breaking of each individually is impossible. The whole thing has to come together. The ground is blocky, and the mere act of breaking it is the least source of worry, that is, providing it does not come too readily—a contingency to be watched. Timber is out of the question; that item alone would be an important one as bearing upon the matter of dividends or debit. Hoisting the waste must be dismissed with the same treatment as the timber question; therefore the question resolves itself into the storing of the broken stuff in the stopes. Now for the waste. Giving it to the mill to sort is impossible, and headroom for any elaborate system of surface sorting is not available without great expense, not to figure on a hoist with a capacity crowded so as to keep it busy on ore proper. Conditions being such, it seems to force the solution back into the mine and to center on devising a method for equal storage in the stopes. But how? I know of a dozen ways wherein it can be done after a fashion, but they all entail a certain amount of "fiddling," and the terms "fiddling" and "economical production" are antagonistic. Cheap mining, stripped of its bulk of contributory conditions, means the breaking of ground at a low cost and the utilizing of gravity at every possible turn. "Don't wear your rock out in handling," is an axiom I digested many, many moons ago. Possibly, some unkind reader will be tempted to remark that the information I am looking for savors of a desire to lift one's self by the bootstraps. But is it? There is one thing that can not be avoided, viz., the sorting of the blocky waste in the mine, which is in a proportion of about one-third, and it is the sorting and storing of this matter cheaply that is the troublesome feature. It can be kept separate by the rearing of cribbing across the stopes at intervals of, say, 30 feet, alternating storages of ore with cribbed cross-sections of waste. This would solve the separate storage question, but it would be the resorting to methods precluding any slashing operations. The rearing of a longitudinal wall of waste on the foot wall has also been considered; but its defects would be many, as it would be a doubtful question whether such a false foot wall would remain intact when surplus ore is drawn away, while the utilizing of a solid cribbed face would be breaking into the tahoeed sphere of expense.

In conclusion, I would say that by entirely replacing present top gear, and by the installing of an elaborate system for sorting, thereby incurring a heavy expenditure, the installation of a more expeditious means of hoisting, and a general transformation in means of operation, a plan could be devised that would prove a true solution, but it is not a scheme that will call for an enormous expense, nor a plan for the courting of an incursion into the directors' hank accounts that I am looking for, but a bright idea for the economical partition underground—something that will allow the cutting of things wide open—a plan whereby present conditions will contain the elements for its practical operation. Perhaps this is a big order, but I cannot get myself to believe that it cannot be done.

Denver, Colo., Nov. 14.

The writer of the above communication is evidently somewhat perplexed, but there may be those who can offer a suggestion to him which may prove of great value, and any solution of this vexing problem that may be offered will be published, for it is only through this exchange of ideas that we get the broadest knowledge. It is here suggested that possibly the desired object may be accomplished by heavily timbering a main gangway along the ore body, lagging the top and sides with poles, chutes being provided at proper distances, usually 30 feet apart, and mill holes (single) being carried up as the work of stoping upward progresses. The waste may then be packed about the timbers, which extend only one set high, and about the cribbing of the mill holes, the ore being sorted out as blasted and thrown down the mill hole. If there is not sufficient

waste made of this system the deficiency may be supplied from the walls, or either of them. In this system it will be necessary to guard against falls of rock from the roof of the stope in large masses. As it is stated that the zone of mineralization varies greatly, it is further suggested that the narrow portions, unless much richer than the wide ones, be left to form arches or pillars to give support to the workings. It may also be found necessary to put in an occasional stull, which may be recovered when the filling has reached it.—Ed.

The Cornish Stamp Mill.

Written for the MINING AND SCIENTIFIC PRESS by C. M. MYRICK.

To one interested in the development of mining appliances no country offers a more interesting field than County Cornwall, England. The latest methods are being introduced, but side by side with them the old ways still prevail. This clinging to old ways is due in part to labor conditions, and partly to a reluctance to scrap old machinery. For many years the hulk of Cornish mining has been confined to the working of tin ore. The tin occurs in lodes, disseminated in a quartzose gangue as cassiterite, an oxide of tin containing 78% metal. To free this oxide the ore is crushed and concentrated, and the nearly clean oxide reduced to metallic tin in reverberatory furnaces. Gravity stamps are used for crushing the ore; and notwithstanding that the old Cornish stamp mills are crude, heavy and noisy, they still handle the hulk of the product. On a very hard and tough ore their capacity per stamp is something over half a ton of ore per twenty-four hours. The stamp proper weighs about 600 pounds and is made up of a mass of iron cast on the end of a wrought iron stem, or "lifter," which is 2x3 inches in size and about 12 feet long, somewhat enlarged where it enters the casting. The cast heads are of rectangular shape, 6x12 inches in section and 2 feet high. They stand in the mortar with flat faces towards one another and very close together. When the head wears away the stamp is sent to the foundry to have a new one cast on. The stamps do not revolve. For a tappet, or "tongue," a massive iron ring is slipped over the stem and held in place by a heavy iron wedge. The cam shaft, or "axle," is a hollow cylindrical casting, 2 feet in diameter, with the shell $2\frac{1}{2}$ inches thick. It is provided with openings, symmetrically spaced, into which steel or wrought iron pieces are inserted and held tight by iron wedges. As the "axle" revolves these projections engage the tappets and thus act as cams. Their positions are such as to lift the stamps in proper rotation. One turn of the cam shaft raises each stamp five times, so that with a speed of fifteen revolutions the stamps drop seventy-five times a minute.

The contrivance is very suggestive of an old style music box on a gigantic scale with its cylinder of

there are extensions 8 or 10 inches in diameter, to serve as journals. Each cam shaft is long enough to take in three or four batteries of four stamps each, and is carried on heavy wooden trestles that are independent of the battery frames.

The mortars, or "coffers," are of wood lined with iron, and each holds four heads of stamps. No dies are used, the stamps simply dropping on a thick bed of ore that always fills the bottom of the "coffer." Instead of ore feeders, each mortar is provided with a broad ore chute extending its whole length. A bin keeps this chute supplied with ore which keeps sliding into the mortar as the stamps beat out the bottom. On account of this feeding arrangement the back or heel of the boss wears away faster than the front, leaving a sloping surface. If this becomes too pronounced, the stamp is turned half way around. In places where the water from the mines is used it was found that iron screens were rapidly corroded. This difficulty was overcome by using punched copper sheets. They are round needle punched, about equal to 20-mesh, depending on the character of the ore. The screens, or "gratings," are made from sheets something less than one-thirty-second of an inch in thickness, and they last from two to three months. When worn out they are returned to the maker for their value as copper. Their first cost

ever, is always under cover. The cut shows a style of engine house that is very typical in Cornwall. It is a massive granite building, with a chimney of invariable shape built into one corner, and with walls heavy enough to serve as a fulcrum for the overhead walking-beam, one end of which extends outdoors. The engine is nearly always a single cylinder, set vertically, with piston rod extending upwards to connect with a walking-beam, and a valve system similar to that seen on the San Francisco ferryboats. It is slow running, and everything about it is massive and long-lived. The photo is of one used for hoisting from a depth of 2600 feet and has the reel keyed to the crankshaft. It would seem an awkward thing to handle, but the engineers soon learn to avoid dead centers. The same general type is used to operate the pumps and run the stamp mills. They are always used with jet condensers and although many of them have been running for two or three generations, they are very economical of fuel. When a mine is worked out and abandoned, everything gradually disappears; but these solidly built engine houses remain as monuments. To day they are a very distinctive feature of the landscape, and their numbers are eloquent of the past activity of the Cornish mining industry.

Danger in Thawing Giant Powder.

The season of the year has arrived when a word of caution to miners everywhere in regions where the temperature goes lower than 45° Fahr. is not out of place, as at that temperature and lower nitro powders freeze and for the time being are useless as a blasting agent, and relatively harmless. Powder in this condition must be raised to a higher temperature by application of heat, but this must be applied very gently or an explosion is likely to result. Nitro powder should never be thawed over an open fire or on the top of a steam boiler. Nor should it be held in the hands and rubbed or squeezed. The oven of the cook stove, or the floor beneath any sort of stove, is equally an unsafe place to put frozen powder for the purpose of restoring it to a proper temperature. It is a strange but interesting fact that while these simple words of caution seem foolishly unnecessary, yet each winter sees just the things done that are enumerated above, with disastrous result, and other expedients even more hazardous are resorted to. It is not because miners generally are ignorant of the likelihood of premature explosion, but long immunity from accident of this kind makes them careless. The safest way to thaw frozen powder is in a covered can immersed in water, the temperature of which, at first low, is gradually raised to 70° or 80°. This may be accomplished in a variety of ways, as has been previously explained in this paper. One safe and inexpensive method is to provide an ordinary oil barrel with two pipes, one inserted in the side of the barrel near its top and the other near the bottom. These pipes should project outward several feet and be connected with each other by a third piece arranged vertically. A fire may then be built under the lower pipe at a distance of 4 or 5 feet from the barrel, which is filled with water to a depth sufficient to cover the upper pipe. The frozen powder in a suitable can is then placed in the water and secured so it can neither sink nor overturn. The can should then be covered, and the heat of the fire will gradually raise the temperature of the water in the barrel and with it the temperature of the powder. This is accomplished so slowly that there is then no more danger in handling the powder than during a day in the spring time.

Since writing the above precaution, the following has come from Ruby, Colo. The method pursued in this instance was both novel and ingenious. It will be noticed that it does not occur in the list of methods above referred to:

Pete Young and Oscar Mack were the victims of an explosion at Ruby last week. The accident was due to careless handling of the giant powder used in blasting. To thaw the powder they cut one end out of an empty powder can, made holes with a pick point in the other end, placed a pit lamp under the can, and three sticks of powder on top of the can. In about fifteen minutes the powder exploded, injuring both men quite seriously. Mr. Mack will recover, unless blood poisoning occurs. Mr. Young's injuries are of a more serious nature, but even he has a chance for recovery.

URALITE is the latest fire-resisting material to claim the attention of engineers, its name being due to the fact that its inventor, an officer of the Russian army, was stationed near the Ural mountains, and that a part of its substance, the asbestos, comes from that quarter of the world. The asbestos is ground to pulp and mixed with about 30% of chalk, to fill up the interstices between the short fibers, and, after passing through various chemical processes, appears in the form of tough, pliable strips. Gelatinous silica is used as a cementing substance, about 20% being used, thus leaving the proportion of asbestos about one-half of the total. The boards made from this substance are claimed to be tough and to stand a large amount of wear and tear, but their chief interest arises from the fact that they appear to be utterly impervious to fire. According to what particulars

Hoisting Engine at "Old Dump Shaft," Dolcoath, Cornwall, Eng.

Cornwall is dotted all over with such structures, all built in exactly the same way. A vertical cylinder is inside and is connected to the outside reel by beam and wooden connecting-rod. This engine is drawing from a depth of over 2600 feet. Two are at work in Dolcoath, also three modern hoisting plants

A Cornish Stamp Battery, Camborne, Cornwall, England.

many projecting pins. Considering that the stamps work in individual cast iron guides, which are generally loose and rattling, it may be imagined that the music from a 200-stamp mill is somewhat titanic. It has the intensity of that from truck loads of iron rails being hauled along a cobbled street, and a peculiar rhythm due to the slowing of the engine as it turns the centers. Heavy cast heads are bolted to the ends of the "axles," and from these heads

seems high but they are really very economical. The engine is located midway in a line of batteries, and the power is sent along through the cam shafts, which engage one another by means of a massive crank arrangement, bolted to their ends. The sweep of the engine is directly connected with this cam shaft line. This, of course, does away with the use of all line shafts and belts, and makes it possible to operate the mills without housing. The engine, how-

are available, they may be planed or sawed like ordinary wood, and glued or nailed with equal facility. Numerous experiments have been made with the material, all intended to demonstrate its superior qualities as a fire resistant, and all appear to have been successful. Doors made of it have withstood extreme temperatures without injury. A deed box was subjected to a very hot fire for an hour and a half. When opened it was found that the papers were not even charred. As a material for constructing file boxes, and in various other ways where papers are to be preserved, it would thus seem to have a large field of usefulness. Its application on shipboard may be another important field.—Cassier's Magazine.

Sturtevant Centrifugal Crushing Rolls.

The 36-inch centrifugal rolls here illustrated are the largest made by the Sturtevant Mill Co. The tires are $4\frac{1}{2}$ inches thick, are of high carbon steel, and have sixteen tons pressure at ordinary speeds. They can be run as fast, or as slow, as required, and attain greatly increased pressures when fast running

Sturtevant Centrifugal Crushing Rolls.

Sturtevant Centrifugal Crushing Rolls.

brings in the rapidly augmenting centrifugal forces. The hearings are dust proof, and the side adjustments simple and durable; tires may be removed in a few minutes, it being only necessary to turn in set screws in the head peripherys, these press back the tire spring weights; then the tire is released and may be slipped off easily. When tires are replaced the set screws are taken out and the tires at once secure themselves.

The manufacturers argue briefly the question of large and small roll constructions, saying: "Since rolls crush by the pressures of their revolving tire surfaces it is plain that if the tire widths and pressures are the same the output of all rolls will be in exact proportion to tire velocities, regardless of diameters. A small roll, therefore, may do as much as a large one, if the tires can attain the same speed."

"The tire surfaces of the smallest centrifugal rolls can equal the travel of the largest roll tires that can be constructed, and do as much work for the same width of tire."

"Centrifugal rolls run with nearly the quietness of dynamos on finishing work. In roll crushing there is

found for each ore a tire speed that gives the largest output per pound of tire wear. This can only be determined by experience. In most cases this economical speed is found to be far above the turning ability of common rolls. Any centrifugal rolls can run to that speed."

"The wear of a small tire surface, even when running at the tire speeds of the largest rolls, is no greater than that of a large tire having the same velocity. In both cases the same amount of metal is exposed to wear in the same time. The smallest rolls, however, must not be used as coarse crushers."

In a handsome circular of crushing and grinding machinery which the Sturtevant Mill Co. of Boston, Mass., issue frequently, and gladly send to inquirers, this matter is further considered.

The Simplon Tunnel.

In drilling the railway tunnel under the Simplon Pass between Italy and Switzerland, the drills used in working the rock are of the rotary type and are worked by water pressure of from 1000 to 1400 pounds per square inch. The water is led through

Diaphragm Lift and Force Pump.

The Edson patent diaphragm lift and force pump, illustrated herewith, as used with the Edson pros-

Edson Diaphragm Lift and Force Pump.

pecting and mining outfit, is made in three sizes, Nos. 6, 8 and 10, with stated capacities of 1000 gallons per hour, one man; 4000 gallons per hour, two men; 6000 gallons per hour, three men, respectively. The manufacturers state that the angular inlet valve minimizes the possibilities of clogging, and that it permits of the free passage of thick sediment, slime and clayey soil.

Regarding this pump W. W. Fisk, manager Boston & Sinaloa M. Co., says: "The pumps work so well that one man can keep a pump going under a head of 15 to 20 feet and keep a good stream of water flowing. We have used them under a head of 50 feet with one man on each brake, and for very fast work at 50 feet elevation we use two men on each brake. They were very satisfactory in every way, gave no trouble and always held their water, even when considerable sand was going through."

Detailed particulars will be furnished by the manufacturers, the Edson Manufacturing Co., 255-257 Atlantic Ave., Boston, Mass.

The Rankin Process.

TO THE EDITOR:—In the process which bears my name I manufacture nitric acid by (A) subjecting dry compressed air at a pressure of 120 pounds per square inch, in a tank 4x8 feet, to the action of numerous electric arcs of peculiar constitution, i. e., as high in ampere quantity as possible, which (unlike the blue static spark) is an orange red, solid flame of intense heating as well as chemical action. This causes the nitrogen and oxygen of the atmosphere to unite chemically to N_2O_3 and N_2O_4 . This compound gas (B) then passes through a transforming vat containing water and powdered silica, which at once absorb the fumes and produce first nitrous and then nitric acid. (C) The nitric acid is then employed to eliminate sulphur, tellurium, antimony, arsenic, bismuth and selenium compounds and other acid elements from the ores, as well as the positive or metallic elements, such as silver, copper, lead, quicksilver, nickel, cobalt, zinc, lime, etc. (D) The residue, which is chiefly silica and gold, is now in condition to be saved by any free milling system, while (E) the solution or filtrate containing copper, silver, lead or other commercial metals is made to deliver up the respective metals by chemical precipitation with use of such reagents as salt and lime, or by electrolysis. With water power we find we can manufacture strong nitric acid for about 3 mills a pound, and with steam, where wood is proportionate to coal at \$3 or \$4 per ton, for about 5 mills per pound, hence can take all ordinary siliceous ores and leach them absolutely free for about \$1 or \$1.50 per ton, saving, besides the gold, any of such metals as silver, lead, copper, quicksilver, cobalt, nickel that may also be in the ore. Of course, the more soluble matter in the ore the more it costs, but I cannot conceive of any ore (even if it were solid lime) that would cost over \$7 to \$8 per ton with the acid at 2 to 3 mills nor is there any common ore of gold, silver, copper

or lead (except the silicate of copper) which is not treatable with the use of different strengths of the aforesaid nitric acid, as any chemist knows.
Pollock, Idaho. H. D. RANKIN.

Mining and Metallurgical Patents.

Patents Issued November 25, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

DEVICE FOR PREVENTING GAS OR OIL WELLS FROM GUSHING, ETC.—No. 714,146; G. R. Cheesman, Auburn, N. Y.

Device for preventing gas and oil wells from gushing, comprising in combination with piping or casing of well, valve chamber secured to upper end of casing, positioned in excavation in ground, struts resting on chamber, planking resting on trusses, and filling over planking, pipe screwed to upper end of chamber, turning valve in chamber, means for rotating valve.

PROCESS OF EXTRACTING BROMINE FROM BRINE.—No. 714,160; H. H. Dow, Midland, Mich.

Manufacturing bromine from bromide-containing brines, bringing unoxidized bromide-containing brine into contact with air, subsequently into contact with air containing free halogen.

METHOD OF LAYING TUNNELS.—No. 714,205; G. Lindenthal, New York, N. Y.

Improvement in tunnel construction producing above path of tunnel, prior to any boring operation thereunder air-resisting zone, then driving tunnel.

PROCESS OF PRECIPITATING METALS FROM SOLUTIONS CONTAINING SAME.—No. 714,599; S. T. Muffay, Bowdre, Ga.

Electro-chemical process for precipitating gold or other metals from solutions, obtaining secondary electro-chemical action by passing solution requisite temperature combined with warm air to supply oxygen through filiform partly soluble composition of lead and zinc inclosed in porous cellular casing of carbon, with suitable plate anode and comprising electrodes having connection with source of electricity.

PROCESS OF MAGNETICALLY AND STATIOALLY TREATING ORES.—No. 714,256; H. M. Sutton, W. L. Steele and E. G. Steele, Dallas, Tex.

The process of separating or concentrating ores by magnetically energizing surface, statically charging same whereby magnetized particles attracted sustain other particles by reason of difference of potential, removal of particles by extraneous magnetic force; first subjecting ores to a combined static and magnetic influence to separate magnetic material, and subsequently subjecting same to direct action of the static electricity.

DRY ORE CONCENTRATOR.—No. 714,257; H. M. Sutton, W. L. Steele and E. G. Steele, Dallas, Tex.

In dry ore concentrator, framework, working table thereon, inclined pervious belt movably mounted on table to discharge by gravity at lower end, air

chamber beneath belt having inclined bottom thereto, receptacle within chamber at lower end thereof to collect and retain by gravity metal falling in chamber, means for producing intermittent blast and suction action upon face of belt, means for moving belt during suction action.

CONVERTER.—No. 714,449; G. C. Carson, Redding, Cal.

Converter, chamber of V shape, having walls thickened toward bottom tuyeres entering walls and discharging into chamber near bottom, and horizontally extending exit for molten metal at apex of chamber.

PROCESS OF TREATING METAL.—No. 714,450; G. C. Carson, Redding, Cal.

A process of treating molten metals, feeding molten metal continuously into suitable vessel, subjecting metal to action of blast of air delivered near bottom, allowing accumulated slag to flow off from surface of metal, conveying purified metal automatically and continuously from vessel below blast line into upper part of second vessel, subjecting metal in second vessel to action of air blast delivered near bottom of the vessel, allowing slag to flow off from surface of the metal, withdrawing purified metal from second vessel below blast line.

FURNACE FOR ROASTING ORES.—No. 714,464; T. Edwards, Sebastopol, Ballarat, Victoria, Australia.

In combination in a tilting ore roasting furnace, a rabble having hollow stem and foot, stem being formed in sections, water-conducting pipe held in place within lower section by being clamped between two sections, discharge pipe leading from lower section and an inlet pipe leading to upper section.

ORE CONVEYING SURFACE FOR ELECTRICAL SEPARATORS.—No. 714,649; H. M. Sutton, W. L. Steele and E. G. Steele, Dallas, Texas.

Ore-conveying surface comprising insulated body having conducting face upon one surface, means for electrically charging conducting face.

The class journal is distinctively and essentially a journal of progress. In this fact lies its strength and purpose, and the moment it loses that feature, from that time it ceases to occupy a sphere of usefulness in the journalistic field. The trade journal keeps pace with the various occurrences in its particular line: The newspaper details events, the magazine elucidates them, but the class journal leads and directs the thought of its readers into such channels as will best enable them to improve existing conditions and advance their various callings in keeping with the rapid progress of the age.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Miners are at work on a mining tunnel at Juneau designed to tap Silver Bow basin to be nearly 2 miles long; stamp mills to be erected on the water front.

All the property of the Last Chance G. M. Co. is to be sold under execution at Juneau December 14th. The plaintiff is J. C. Hile of Philadelphia, one of the largest stockholders in the company, who has a judgment for \$23,000 for money advanced. The company will be reorganized and work resumed.

The Dispatch reports the sale of the Cracker Jack mine, on Twelve-mile Arm, Prince of Wales Island, to H. Bratnaber, for \$200,000.

The Treadwell Co., Douglas Island, is using 150 tons of coal daily. The entire plant is now run by steam power.

The Alaska-Perseverance mine is running band drills, there being no water for power.

Nome reports that Olsen & Yarnell have found 15 feet of pay gravel on their No. 2 claim, Dahl creek, in Kougarok; in a few days they panned out \$1600 off head-rock; the pay streak is on the left limit of the claim and extends into the bench; they are having a steam thawer constructed.

Nome says the mouth of Snake river at Nome is to be changed by artificial means; it has been making its way eastward and north, encroaching on the city.

ARIZONA.

COCHISE COUNTY.

The unwatering of the Tombstone Con. mines is well under way; pump capacity 1800 gallons per minute.

The Prospector says at Tombstone, the shaft is down 640 feet and the volume of water is increasing, but is not yet sufficient to keep the 6-inch sinking pump working to its full capacity of 500 gallons per minute. The water from this pump is forced from the sump to the 600-foot level, from where it is thrown to the surface. The pump on the station is at present run about half an hour on each of the eight-hour shifts. This pump when run to its full capacity will lift 1800 gallons per minute. The six pump men have been divided into three shifts of two men each. The water is run from the shaft in a pipe to a point near the Sterling silver mill, on the Charleston road.

Two months ago a party headed by Captain S. Mitchell visited this section and handed the Gus Baron property, and Captain Mitchell and Mr. Young are at Bisbee to make a payment, take possession of the property and commence work. There are thousands of tons of ore on the dumps. The new owners will put up machinery.

GRAHAM COUNTY.

At the Buckeye Co.'s camp, 8 miles southwest of Bowie, Dos Cabezas mountains, the new fifty-ton concentrator is in operation. A test was made on low-grade ore from the dump, and produced concentrates carrying \$70 to the ton in gold, silver and lead. The mill is now running on ore, averaging \$15 and concentrating eight into one. The ore body dips at an angle of 32°, and has been exposed by erosion for 1600 feet. Entrances have been made at six places, the openings penetrating the ledge on the incline upward. Fifty men are employed; O. B. Todhunter superintendent.

PINAL COUNTY.

At the Bonanza G. M. & S. Co., near Casa Grande, Manager J. C. Loss will install a steam hoist, air compressor, machine drills, and sink the shaft to 500.

The O. D. Co. at Globe has blown in its second furnace and increased the number of men employed at mine and smelter, and the Old Dominion Co. is engaging a large number of new men.

YAVAPAI COUNTY.

(Special Correspondence).—This Territory is an ideal winter camp for the prospector and miner. It is true we have had three or four days of continuous snow storm, which is unusual, but the snow has now nearly disappeared.

The Model G. M. Co. is working nearly 100 men at this camp, mostly on shipping ore, being limited in milling facilities (ten stamps) on account of a shortage of water. This camp is 18 miles east of Prescott. At the Model mine proper, nearly 40 miles southwest of Prescott, they have uncovered a vein by accidentally striking a pick in the side of the shaft at a depth of 300 feet while making repairs. They broke into a vein that sparkles with gold. It is now opened 60 feet along the shaft. The

paystreak is 2 inches wide, which will average \$15,000 or \$20,000 a ton.

This Territory is handicapped by lack of water, but it has an abundance of gold. McCabe, Nov. 28.

Superintendent Bartholdi says he will begin development work on the Verde Chief, near Jerome.

Jerome says Superintendent Giroux is erecting a smelter at the Iron King.

Jerome reports that the United Verde smelter has resumed operations. The smelter was closed down since August on account of fire in the mine.

The snowfall of the past month is without precedent in recent years. All the mountains of northern Arizona are covered with snow. The Hassayampa river, which the past fall has been dry, is again a living stream and is likely to continue as such throughout the coming year. There has been a shortage of water in northern Arizona for metallurgical operations the past three or four years, but the present heavy snowfall will afford an abundant water supply.

CALIFORNIA.

AMADOR COUNTY.

The Bunker Hill mine, near Amador City, which is now opening a large new ore body on the 1400 level, contemplates the addition of several new machine drills. The smaller sized drills have been in use in the mine for some time past.

At the Shenandoah mine, near Plymouth, the shaft is down 900 feet. At 1000 feet a drift will be run to the ledge.

Superintendent W. R. Thomas of the Central Eureka mine, Sutter Creek, is making a comparative test of machine drills in that mine, the compressor plant having been completed.

The South Keystone mines, locally known as the McIntyre property, owned by John McIntyre of Sutter Creek, situated between Amador City and Sutter Creek, is to be opened through the old vertical shaft of the North Star mine. The shaft is 1000 feet deep, but has been flooded for years and the collar of the shaft caved. The cave has been caught up and the process of unwatering the old works will begin as soon as suitable hoisting machinery can be placed on the mine. It is reported that the South Spring Hill workings, from the Talisman shaft, accidentally encountered a pay shoot in what is supposed to be one of the South Keystone veins. It is to explore this ore body and to prospect for others that the new work has been undertaken.

The final payment of \$8000 has been made on the Rhetta mine, near Plymouth, which was bonded three years ago for \$15,000 by W. W. Worthing of the Rhetta Co.; the same company owns the McGee and Kretcher, adjoining the Rhetta, and has the Bay State bonded for \$20,000, about half of which is paid, the properties being worked with a 10-stamp mill, which will be enlarged.

The frame for the new 60-stamp mill at the Kennedy mine, near Jackson, is going up and the mortars will soon be placed in position. Good headway is also being made in the erection of the large new hoisting engines. The new vertical shaft has reached a depth of 2632 feet; sinking has been discontinued for a time; a cross-cut will be run on the 2550 level of the new shaft to connect by raise with the bottom of the old inclined north shaft.

The strike on the 1400 level of the Bunker Hill mine, near Amador City, has now developed 25 feet of \$8 ore, and a drift is being run along the foot wall to further develop this ore body. There is also good ore on the 200 and 800 levels. In view of this showing the company intends to build a stamp mill, the size being determined by the result of further development. A station has been recently cut at the 1250 and a drift started north to prospect for the new ore body on this level. A large new hoist is also in contemplation.

CALAVERAS COUNTY.

The two lowest levels in the Sheep Ranch mine, which are 1200 and 1300 feet respectively below the surface, it is reported, show a great improvement over the 1100 level and the mine is now operating at a profit. This mine in former years was a noted producer. It now gives promise of again renewing the rich shipments of former days. James Langford is superintendent.

The Chronicle reports hydraulic work at the Lancelle gravel mine, near Buckeye; five men are at work.

The Prospect says mining is being resumed at Douglas Flat. Superintendent J. Evans is opening up the Wild Goose and putting in a water-power hoist. Negotiations are pending for the sale of the Ozark mine, near Murphys.

Oil-burning machinery has been installed at the Angels mine at Angels Camp, being the first mine there to use oil.

The air compressor of the Crystal mine, Angels Camp, is in operation.

The Dower and Calaveritas Hill placer

mines, near San Andreas, have resumed. Manager J. J. McSorley has men widening the McDermott ditch. Two miles of pipe have been placed, capable of carrying 600 inches of water, and \$20,000 will be spent in development.

At the Royal mine at Hodson graders are at work for a 120-stamp mill. Fifty men are employed. The new mill will have each battery of ten stamps operated by a separate motor.

Prospecting has been again begun on the north end of Stockton ridge at Mokelumne Hill, in search of opals. Early miners in this district in driving tunnels in the white rhyolite tuff on the ridge found numerous opals but mostly of inferior character. It is believed deeper workings may find the peculiar siliceous secretion known as fire opal.

EL DORADO COUNTY.

Georgetown reports that Eastern men will open up the Rosencrans mine at Garden valley.

Work has been resumed on the Ford copper mine near Georgetown.

GLENN COUNTY.

It is reported that oil has been struck in a hole hole 2000 feet deep on the Nye ranch 14 miles west of Willows. It is the first oil strike reported from this county.

HUMBOLDT COUNTY.

The discovery of gold-bearing veins is reported from Orleans district on Klamath river. A similar report comes from Wilder Creek.

INYO COUNTY.

(Special Correspondence).—In the Morning Star mine is opened up fluxing iron ore, which carries also values in gold and silver. In 1900 were shipped about 400 tons of this ore to Selby's. A control sample of this entire shipment gave an analysis of 40.55% iron, or 58.9% FeO, and only 5% silica. There are hacks of 350 feet of this ore. They are installing a Fairbanks-Morse gasoline hoist in the tunnel to sink 300 feet deeper. They will then go down lower on the mountain and drive another crosscut, which will open up the mine for permanent working. Cerro Gordo, Dec. 1.

KERN COUNTY.

Near Bakersfield, the Mountain Boy, in the Midway, will drill another well. No. 1 yields seventy-five barrels daily.

The Californian says the Southern Pacific intends putting down a well to a depth of 2000 feet, the deepest yet to be drilled in the Kern River district.

The Sunset Crude will build a refinery on its lease at Sunset, to cost \$15,000.

MADERA COUNTY.

The Gambetta mine at Grub Gulch is bonded to a Montana company. Superintendent E. D. North will sink the shaft 200 feet, drift both ways, drive a raise from the 800, put up another oil tank 10,000 gallons. Tanks are in at 800 and station pumps are in place. The Josephine is included in the same bond.

Superintendent Ward of the Rex mine says he will resume as soon as there is water to run the mill.

MARIPOSA COUNTY.

The Mariposan reports a placer strike on the north side of the Merced river, opposite McCabe's Flat. Recently permission was given two miners to work the claims on shares. They tunneled through the reef of rock where earlier work had stopped and struck gravel that paid \$4 per wheelbarrow load. The channel is 800 yards long by 40 to 60 yards wide.

MONO COUNTY.

Bridgeport says there were ten mining and three water claims recorded in November.

The cyanide plant of the Standard Con. M. Co. at Bodie has been closed down for the winter. The slum pond is being emptied for winter use, and the tailings being frozen, it is necessary to blast.

In the Southern Con. mine, near Bodie, the Addenda ledge has been cut at a depth of 500 feet.

NEVADA COUNTY.

The mill on the Allison Ranch, near Grass Valley, is crushing rock from the 800 and 900-foot levels of the mine.

The Conlin mine, near Grass Valley, will resume and will use oil for fuel.

The shaft of the Blue Tent mine, near Nevada City, caved in last week, it is claimed due to the sliding of quicksand, and discovered as the men were changing shifts so no lives were lost. Thirty feet of column pipe was lost. Manager C. Jepson estimates the damage at \$7000.

Near North Bloomfield, the Union Blue Gravel Co. is putting up a mill to crush cement and gravel that cannot be washed.

PLACER COUNTY.

The Bear River G. M. Co., near Colfax, is putting in hydraulic pipe and machinery.

The Gaylord gravel mine, near Auburn, will be opened up by Oakland men. A

hunk house has been built and work is being pushed on the mill and in the tunnel. E. C. Gaylord is superintendent.

S. D. Nesmith will work the Jubilee mine, north of Auburn, and will use the Marguerite mill.

PLUMAS COUNTY.

A group of mines at the head of North canyon, near Greenville, has been sold by Stone & Richards to Droege Bros. of Covington, Ky., E. N. Cornell of Milwaukee and W. Day of Butte county.

Greenville says Eastern men have an option on the Firmstone and Richards properties in North Canyon. The mill will be enlarged. F. W. Day of Butte county is manager.

RIVERSIDE COUNTY.

Acting for Eastern men, J. F. Cullen has bought the Iron Chief mine, near Walters, and will put in a pumping plant, gasoline engine and 4 miles of pipe.

SAN BERNARDINO COUNTY.

Needles says the Federal M. Co. at Vanderbilt are looking for miners; also the Gold Bronze Co. The Gold Bronze mill is running and the mill at the St. George is being installed.

The Mojave, adjoining the Snowball, has been bonded for sixty days, also several mines near Goode Springs and three in the Soda Lake district.

The O. K. group of mines, Virginia Dale district is sold to A. M. Hinckley of Middleboro, Mass., for \$75,000. The O. K. vein is from 2 to 5 feet wide and is developed to a depth of 300 feet. These mines are in a range of mountains about 50 miles from the nearest railroad station. Water is obtained from a dry lake on the north side of the range.

SAN DIEGO COUNTY.

The Miner says near Julian, Superintendent G. H. Moyer, Boulder Creek M. Co., is pushing the development work on the Pandora claim. Feeler & Moor are developing the Last Chance.

The Union reports a smelter for Julian by a corporation of Los Angeles men—the Julian Reduction Co. The reduction works and furnace will have a capacity of 100 tons per day; the Weist process will be used, as the ores of this district contain sulphides and sulphates of the baser metals. The principle is to set free values in refractory ores by chemical action, produced by a flux, which is an oxidizing agent, little heat being necessary to start chemical action—400° to 600° F. Wood can be used for fuel. This heat is not high enough to volatilize the gold or silver, while the baser metals will be oxidized and pass off.

SHASTA COUNTY.

At Redding, the Gold Mountain M. & M. Co. has incorporated to operate properties on Salt Creek in the Shasta mining district; D. N. Honn, F. L. Honn, E. P. Conner, J. G. Conner and A. Bell.

At Old Diggings, near Keswick, the Texas and the Evening Star mines have shut down, due to the smelter strike at Keswick, as their ore was shipped to the smelter.

As a result of the strike of smeltermen and miners at the Mountain Copper Co. and the closing down of the Iron Mountain mine and Keswick smelters, the Northern California Power Co. will suspend work on the Cow creek electric power plant now in course of construction. This will make 100 men idle and may prevent the installation of this plant, which was to have been the largest power plant in northern California. Superintendent Johnson has been directed to suspend work, pay the men and discharge them. The strike situation is unchanged.

The Connors G. M. & M. Co. has received its incorporation papers. It was first organized as the Clear Creek Co., but changed as there were already several companies doing business under that name.

Construction of the electric power line from the main line of the Northern California Power Co. to Bully Hill mines is approaching completion. The introduction of electrical power at the mine and smelter at De Lamar will effect a saving to the company more than it has to the Mountain C. Co. at Keswick and Iron Mountain.

The mine and mill at Bullychoop are giving employment to about sixty men. The new 10-stamp mill and 5-foot Huntington mill are running. The mill did not run steadily last month, but 1400 tons of ore were treated. There has been a foot of snow at the mine.

SIERRA COUNTY.

The Bellevue (Thistle) tunnel, near Sierra, is in 4000 feet; although it starts in Sierra county, it is headed for gravel in Plumas. An average of 75 feet per week is made.

SISKIYOU COUNTY.

The Quartz Hill mine at Scott Bar has been incorporated by New York men, as the Scott River G. M. Co. Machinery,

steel pipe, etc., is being forwarded to reconstruct the ditches, flumes, pressure pipe for power plant, which will be followed by a 40-stamp mill. J. F. Boyle is manager.

Superintendent Turner is pushing the work at the Cherry Hill quartz mine on Cherry creek with thirty-five men. The mill has resumed.

The cold spell last week stopped the water flow in the small streams, causing a suspension of mining in the placer diggings.

D. Jones, representing an English syndicate, has been inspecting the coal mine at Herr's ranch, between Yreka and Ager, with the superintendent, B. A. Cardwell, with a view to purchase, the intention being to put up smelter, coke ovens, etc., and to build branch railroad to main line of S. P. Co.

TRINITY COUNTY.

(Special Correspondence).—At the Dorleska mine, on Coffee creek, a large body of gold ore has been encountered. Last week and the week before thirty pounds of gold was taken from the mine. The property is owned by Los Angeles capitalists, among them United States Marshal Osborne. The company will in the spring add new machinery and make improvements. The Three Peaks, adjoining the Dorleskas, and of which J. J. Chambers is general manager, is said to contain ore of a similar character.

Redding, Cal. Manager J. Porter, Fairview mine, near Trinity Center, last week shipped the first bullion from the new 10-stamp mill—a \$5000 bar, the result of less than a month's run. The company purchased the Fairview mine last spring for \$60,000; and built a road from a junction with the French Gulch and Trinity Center road to the mine, a distance of 12 miles. A 10-stamp mill was erected, a store, mess house and other buildings, at a cost of \$40,000.

Work is being pushed on the mill at the Three Peaks mine and the stamps will be dropping next week.

E. Wallace is working the Snowflake ledge of the Schroeder group at Deadwood, and also the mill.

TUOLUMNE COUNTY.

At the Mohican mine, near Groveland, Superintendent Chappellet intends to sink another 100 feet, says the Independent. The Maryland, adjoining the Mohican, will also resume.

At the Golden Rule mine, Stent, a new ore chute was built during the shut down.

At the Bell mine, at Tuttle town, Superintendent W. J. Rule is driving levels north and south at the 400 and has the shaft down 450 feet. A test run of rock is being made at the Sutton mill.

W. L. Holmes of Detroit, Mich., has a bond on the Mapes group of mines at Yankee Hill, \$10,000 to be paid in two years, the balance on basis of 15% of gross proceeds. Machinery will be installed. G. W. Mapes is superintendent.

The Electric M. & D. Co. has incorporated with San Francisco men to work the Electric mine, near Sugar Pine. G. C. Kirby, W. McMurphy, J. R. Foley, E. Woodward; G. C. Kirby is superintendent. A shaft is being sunk and a hoist and a 10-stamp mill put up.

At Quartz the incline shaft at the Dutch mine is down 1420 feet. Connections are being made on the No. 13 level with the winze sunk from No. 12 level.

About forty men have been put to work at the App mine. The mill has resumed.

Men were put to work in the Jumper and Golden Rule mines at Stent last week. Superintendent Kerr has given orders that no man who is unable to understand and speak the English language will be given work in these properties. The sixty stamps in the Jumper mill are dropping.

Near Columbia the Densmore mine is running and the stamps are dropping in the mill.

At the Altadena mine, formerly the Kearsarge, hydraulic pipes and machinery are being laid down. This property is under bond to San Francisco men. A 10-stamp mill will be erected.

A new company has secured a bond on the John Royal mine, owned by E. C. Day and others, and will erect a 10-stamp mill.

The \$50,000 damage suit of D. Manning against the App M. Co. resulted in the jury awarding the plaintiff \$5000. In February last the plaintiff while at work at the 1100-foot level of the App mine was crippled by being struck with a timber which fell from the skip.

A new find has been made on the Baker ranch, near Carters, at a depth of 70 feet. The formation is granite.

The river channel has been struck in the Ranch mine, near Columbia, by a shaft 110 feet deep. The operators have a bond on the property for \$16,000.

YUBA COUNTY.

Work on the quartz claim of the Eagle Canyon M. Co., near Marysville, is being pushed, and an 8-foot vein is opened up

assaying \$4.50 a ton. A mill will be erected in the spring.

COLORADO.

ARAPAHOE COUNTY.

A smelting plant, backed by large capital, is under consideration by railroad and financial men of Colorado and the East. The project is the largest smelter undertaking ever known in Colorado, with the exception of the smelting trust, which is capitalized at \$100,000,000. The company is independent from the trust.

BOULDER COUNTY.

The St. Louis mine on Boulder mountain at Cardinal, is running three shifts sinking the shaft. Manager Haberl expects that with the development now being done to keep the mine running constantly next summer, and says that deep mining is what is required to prove up the mines on this mountain.

The Sweet Home Co. on the same mountain are pushing their tunnel level and have opened up a fine body of milling ore.

In the Anchor property, west of Caribou on Idaho mountain, miners have opened up a fine body of ore under the management of Charles Wolf & Co.

A. Trollope is working a crew on his property at Cardinal and obtaining good values. It is thought that he has the east extension of the big Cardinal vein of the Boulder County mine.

The people owning the Boulder County mine have encountered ore bodies in recent development work. They are treating 600 tons a month in their mill. In one of their workings is reported 9 feet of \$50 ore.

The Longfellow, near Eldora, reports a 30-inch body of smelting ore opened, running \$200 to the ton. The ore is an iron sulphide with calaverite.

CHAFFEE COUNTY.

Developments in Granite district during the past months led to the belief that the ore will be opened in sections of the district not previously regarded with favor. The old producers lie to the east of the town. North, south and west prospecting is being done. The formation is granite. In this are the Magenta, Yankee Blade and Robert George. In these mines has been found rich ore in narrow veins. High freight and treatment charges made the profits small and the discovery of Leadville diverted capital from their development. Colorado Springs men have acquired several of these old mines and are developing them with prospects of financial success. One of the mines in this section of the camp is the Washington, owned in Colorado Springs by Messrs. Noble, Stubbs & Parker. The smelting ore varies in width from 6 to 18 inches. Its value is said to be \$40 to \$80. The gangue is decomposed granite and is said to average from \$4 to \$7.

The first gold brick from Granite, the result of a trial run on low-grade rock at the Magenta mill, was shipped out last week.

G. M. Webster has located a 4-foot vein of gold ore in the Sangre de Cristo mountains that assays \$35.

The management of the Columbus mine at Monarch has recently made a thorough investigation of the property and decided to build a plant with which to treat the ore. This is an old producer.

CLEAR CREEK COUNTY.

At the Terrible, near Silver Plume, a compressor is being installed and work on the new mill is being pushed.

The St. Paul G. M. Co. is preparing to start work on the Lone Jack lode. A tunnel has intersected the vein 250 feet below the main shaft, in which there is a large streak of good ore.

Another contract has been let on the Buckeye State group, on Democrat mountain. There are several streaks of ore in the breast of the drift. The ore carries lead, silver and gold.

J. F. Stanish is grading for a building preparatory to the installation of a hoisting plant on the Last Chance group, on Silver creek. There are 10 inches of ore in the shaft worth from \$150 to \$200 per ton.

Idaho Springs reports a 6-inch shoot of three-ounce gold ore on the Mona claim of the Sylvia G. M. Co.

The Donaldson Mt. M. Co. will resume. The tunnel to be driven 3000 feet to prospect Mt. Donaldson is in 200 feet.

The mill of the Idaho Springs M. & R. Co. has been sold to Denver men.

The Cleopatra, at Empire, is sacking ore from the face of the tunnel.

At the Seaton mine on Seaton mountain development work on the ninth level has opened a large ore body. In several of the steeper large bodies of ore are exposed, but the machinery on the mine is being taxed to its full capacity. M. S. Rosenthal, secretary of the Seaton Co., intends installing a new plant which will include an air compressor.

R. C. Vidler reports that the Vidler tun-

nel property, near Georgetown, is to be incorporated and the tunnel driven rapidly. Early in the spring the water-power plant will be constructed and power drills employed.

The Notaway M. Co. contemplate sinking a new shaft at the point of junction of several veins on their property, which will eventually become the main shaft of the mine. This will necessitate a new hoisting plant.

The Seaton mine has been opening up new ore bodies below the 700-foot level, making an average output of 700 tons per month. In making an upraise from the ninth to the eighth level a body of smelting ore, running four ounces gold, sixty ounces silver and 20% lead, was recently found.

In the Alpine, at a depth of 350 feet, the ore body consists of 10 to 14 inches of copper and lead, the values being \$75 per ton.

CUSTER COUNTY.

The Florence M. & S. Co., near Custer City, are driving a tunnel on the Combination, one which will open up the Summit and Nebraska claims.

EL PASO COUNTY.

Potvin Bros. have a lease on the Lexington Co. property north of the Gold King, near Colorado Springs.

FREMONT COUNTY.

The copper reduction plant at Parkdale of the Greenbaven Mountain M. & M. Co. is completed. The mill has a 75 H. P. engine to run the dynamos and combined air and steam compressor, also a Leyner heater. The pulverizer has capacity 150 tons daily to sixty mesh. This machine has three cylinders in one frame independent of each other; each cylinder has a horizontal shaft on which are eight steel arms, to which are bolted paddles of phosphor bronze running 1600 revolutions per minute; two run in one direction and the others opposite, with a current of air forced in under the feed. The pulp is drawn from the cylinders by a suction fan to the dust chamber, where it is conveyed by elevator to ore bins. The pulp is next put into a wooden tank, where the chemicals are applied; the copper and gold are reduced to a chloride. The process is the old patio or leaching process, with the addition of hot air to aid in reducing the pulp in twenty minutes instead of four days.

The United States Reduction & Refining Co. at Canyon City are to make extensive changes and improvements in their lead-zinc smelter. A sampling works is also to be added to the plant.

GILPIN COUNTY.

The Pewabic group, near Central City, has been unwatered and miners put at work cleaning out the Richardson workings. It is also expected that work will begin on the Iron mine.

The Avon M. & M. Co. have the San Juan mine on Quartz hill, and are repairing the machinery and shaft building. The ore will be shipped to the Avon Co.'s mill in East Nevada.

Central City reports hoists and shaft buildings are being put in at the Belden mine, Chase gulch, and also at the Haseltine mine, Russell gulch. Sinking is resumed at the Fairfield mine, Russell gulch.

The Fostoria M. Co., B. M. Myers of Central City manager, has bought the Hall ranch, Pleasant Valley district—eighty-seven acres patented ground—and will put in a gasoline hoist and electric motors to operate drills, pumps, etc.

Central City reports that the Gauntlet G. M. Co. will resume work and sink the main shaft on Quartz hill to 400 feet. At the Barnes mine the shaft is down 700 feet.

At the Lotus mine in Russell district drifting is in progress at a depth of 550 feet on the west side of the shaft to catch the vein on that side with greater depth. A raise is being made to the upper level. The water is kept below the 550 level, being lifted to the first level by a steam pump. Sternberger Bros. own this group. They are also sinking a new shaft on the Peck claim to the east of Leavenworth gulch. The shaft is down 70 feet. A small building and steam plant has been put up. F. G. Wood is superintendent.

At the Fairfield mine in Russell district the shaft shows a crevice of free milling ore alongside of which there is a streak of yellow copper smelting ore a foot in width. Drifting is being carried on in the lower levels. Several tons of ore have been shipped to the Treasure mill at Black Hawk. A carload shipment of smelting ore will be made to the Denver smelters. This class of ore runs up to \$150 per ton. R. Broad is superintendent.

At the Forfar mine on the Pewabic mountain the water is below the 140 level and ore is being taken from the 70-foot level. Lessee E. S. Moulton will make a shipment of from seven to eight cars of the ore to the Rocky Mountain plant at Black Hawk, and will then unwater the

property to its fullest depth of 300 feet. A gasoline hoisting plant and building was recently erected.

The Bona Venture Con. M. Co. is retimbering the Pewabic tunnel, south of Russell gulch, and snow sheds built at the mouth of the tunnel. T. M. Skinner of Denver is in charge. Work will be resumed in the main tunnel, it being in 1000 feet. There remains 100 feet of further driving to intersect the veins, five in number.

Eastern parties have started development on the Russell & West Pewabic property in Russell district and put up a new shaft building. Sinking is in progress with three eight-hour shifts, and the shaft is down 200 feet; some yellow copper ore showing in the bottom. A Thompson is superintendent.

Sinking has been stopped at the Robert Fulton mine at the head of Graham gulch by the Russell Gulch M. & Dev. Co. The shaft is down 240 feet. Drifting has been commenced at that depth. The company is taking out ore which is being shipped to the Idaho Springs concentrators.

Manhire Bros. have their new building completed on the Kemp-Cushman mine at the head of Leavenworth gulch and have put up a plant of machinery. The shaft shows a streak of smelting ore.

HINSDALE COUNTY.

Arrangements are being completed for resumption of work at the Golden Fleece. The remodeling and rebuilding of the present mill are contemplated.

JEFFERSON COUNTY.

At Golden, Manager F. R. Carpenter has one of the furnaces of the Clear Creek S. & R. Co. out of blast, owing to a shortage of limestone. The company is hauling limestone from beyond Pueblo and the plant is running only on the residue on hand. It owns quarries within a few miles of the smelter, but the roads are bad at this season.

LAKE COUNTY.

The Sharp Gold Mining Association is to be organized for investigation of Leadville Basin. Operations will begin on the west side of the basin.

The recent strike in the Chautauquan shaft of the Forest City M. Co., on Little Ellen hill, is improving. The sulphide ore at the 160 level still holds out, the oxidized material has widened to 4 feet, assays give gold, silver and lead \$50 a ton. Manager Carpenter says the property has the appearance of making a mine.

Under the new schedule which the smelting company has made on low-grade iron there is an increase in iron production of Leadville. The Sixth Street shaft is taking out 250 tons per day, and mangiferous iron ore, which contains a few ounces in silver, is now being mined in other properties. The Caribou is preparing to increase shipments of iron, and will by January 1 be producing 200 tons a day. A year ago the best smelter returns on down-town iron were between \$4 and \$5, but now the best average is from \$3 to \$3.50, due to the fall in silver and a slight deterioration in grade.

Unexpected geological conditions have been found under Brece hill in the Yak tunnel. Heretofore it has been the belief that the sedimentary formation had practically been displaced on Brece hill by the igneous rock. The finding at about 1300 feet from the surface of about 400 feet of limestone and quartzite is considered of great importance from the standpoint of prospective value.

E. W. Keith, representative of the Cherokee-Lanyon Spelter Co., of Gas, Kan., is shipping to that plant thirty tons daily of siliceous ores. The company treats zinc-iron sulphides for making spelter. After the extraction of the zinc the residue of the ore, representing 50% of the raw material, still contains values in the precious metals and also lead. The company has a seventy-five ton furnace to treat this material and is drawing on Leadville for its siliceous mixture. The minimum limit is \$15 ore.

Near Leadville, Manager Cooper is pushing development work at the Cady shaft of the Progressive M. Co. Ore has been opened up in the south drift, a sample running 42% iron and manganese, and silver \$2.80. This iron body is 15 feet from the shaft and in the flint. The lead carbonate body has been followed 14 feet and a winze started in the drift; ore bins are being built. Assays from the bottom show .08 of an ounce gold, 32.3 silver and 31.5% lead.

The Chippeewa M. Co., owning the ground on Brece hill where the Chippeewa L. Co. is working, has declared two dividends of $\frac{1}{2}$ cent each, a total of \$2500, making four dividends paid out of the royalties received by the company.

OURAY COUNTY.

Owners of the Ouray Chief at Ouray intend to put in air drills. New houses have been erected and a road built to the mine. A rich vein of ore has been found.

At Ouray the Caroline M. Co. has

started its new power plant. It is of 500 H. P., and with the other three power houses will furnish power enough to work the shaft of the Revenue.

RIO GRANDE COUNTY.

Reynolds, Palmer & Schuch are to attempt to work the Reynolds ores by cyanide and machinery will be ordered.

SAN JUAN COUNTY.

At the Anglo-Saxon tunnel, owned by the Gold King M. Co., a new building, 18x24, has been erected, and a new 50 H. P. engine installed for running the compressor.

Mr. Neigold states that a mill will be built for the Neigold properties in Cunningham gulch as early in the spring as possible.

A force of fifty men is employed at the Black Prince mine on King Solomon mountain. Many are carpenters erecting necessary buildings and extending the Contention tram to the property.

It is reported that the Silver Lake mill at Silverton is to be enlarged to a capacity of 1000 tons per day.

A. Saenger is developing claims on the Cement creek slope of Boulder mountain, and ore showing lead and copper and carrying gold values has been found. Neef Bros. of Denver are interested with him, and development will be started in the spring. There is 4 feet of concentrating ore, with a 2-foot rich streak. A shoot of tungsten ore has also been found in one of the veins.

SAN MIGUEL COUNTY.

The last annual report of the Tomboy Gold Mines Co. for the fiscal year ending June 30, 1902, has been made public and shows a net profit of \$387,275. There was mined and milled 85,726 tons of ore, which yielded \$356,065 in gold bullion. The working expenses were \$501,748, or \$5.85 per ton. The manager, J. Herron, says requirements in new properties, purchased and under bond, made it necessary to limit development work in the old mine. The development performed was: Drifts 1357 feet, raises 253 feet, crosscuts 28 feet.

During the year the Tomboy proper produced 48,644 tons of ore, which yielded \$329,232, an average of \$6.77 per ton, at an expense of \$257,468, a profit of \$71,264.

Manager G. R. Pickett, Carbonero mines, near Ophir, reports an 8-inch streak of galena in the crosscut. The main vein is galena and lead carbonates with gold and silver, netting \$50 per ton.

The 30-stamp addition to the Ophir Con. mill, at Ophir loop, is in operation, making fifty stamps, treating ore from the Ida vein, free milling the bulk of the values being saved on the plates.

It is stated by the managers of the several important mines about Telluride that all of the mines, excepting the Smuggler-Union, will continue work throughout the winter. Indications point to a long shut-down at the Smuggler. The horses and mules used in the mine have been taken to the valley. All movable machinery and tools are being taken from the mines, and changes all tend to justify the report of a permanent closing.

TELLUR COUNTY.

(Special Correspondence)—Shaft No. 2 of the Portland G. M. Co., Victor, is down 1250 feet, are hoisting 600 tons per day with cages, will install three skips instead of cages, skips each hold 70 cubic feet. Each trip of the engine will hoist a three-ton load, or 1000 tons per day. This is something new for the Cripple Creek district. The skips will dump into side-dumping surface cars with 80 cubic feet capacity which will be self-dumping and hauled out on the dump with a rope haulage. The waste rejected from the ore house, after passing through the washer, will be elevated back up to the collar of the shaft and hauled out on the dump by the same cars and haulage. By this means they will do away with several top men and ore-house trammers and reduce the expense of operating considerably. This mine, along with other mines of the district, commenced with high-grade ore and was not expected to handle large tonnage, but as the mines increased in depth the ore is lower grade and large tonnage is now the main feature. They will install belt conveyors for sorting the ore. The ore is a concentrating proposition, but instead of concentrating by machinery it is done by hand. Instead of the values being in the heavy material, they are in the light, and anything in the way of mechanical separation of the ores must have that fact in view. The ores have always been handled automatically so far as saving the fines by screening, but the material that is not screened has to be sorted by hand.

Several schemes are either in use or in contemplation for cheapening ore sorting by means of washing the ore before it is sorted, then sorting it on belt conveyor instead of tables. It is understood the Gold Coin mine has a washing and sorting

device of that kind which seems to be giving good results.

The Taylor & Brunton sampler at Victor, known as the Portland plant, is handling about 300 tons per day.

The Strong G. M. Co., Victor, consider that they have demonstrated that the ore extends into the granite. They are now taking out ore 500 feet from the contact. The shaft is 900 feet deep; hoisting goes on from the different levels.

The Economic G. Extraction Co., Victor, are running full capacity, treating ores from Woods Investment Co. properties as well as custom ore.

Victor, Nov. 30.

Ore is being shipped by six sets of lessees operating on the Free Coinage ground at Cripple Creek.

Masons are rebuilding the wall of the Economic mill, Cripple Creek, which collapsed last week.

A leasing company has taken a three-year lease on the property of the Glasgow G. M. Co. on Iron mountain. Work will be started on three claims. In one is a vein which assays from \$14 to \$29.

Reld and others, leasing the Burns of the Acacia Co., have installed a new plant. A strike was made a few days ago.

Ferguson & Co., on the Zenobia, have made a discovery at the 350-foot level in following what was believed to be a slip, and are breaking 3 feet of ore that will average two ounces to the ton.

Sifton & Co. of Colorado Springs, who bought the lease on the Grace Greenwood, have begun mining under Superintendent Friar. The ore body lies at a depth of 25 feet from the surface. It is 10 feet wide, and has been opened laterally 30 feet. Its value is \$25 in gold to the ton.

Hansen and others, lessees of the Zoe on Beacon hill, are breaking ore at a depth of 400 feet. The shoot is 4 feet wide and was discovered near the bottom of the shaft. It runs \$50.

In the Empire State mine, on Bull hill, Cripple Creek, only development work has been done during the past eighteen months and eight veins found, all carrying pay values; the largest was cut at the 750-foot level, where a drift has been run on it 265 feet. Two drifts have been run along the basalt dike, showing a width of 40 feet. No stopping has been done, and only two small machine drills have been working on ore. The screenings from this ore have averaged \$50 a ton, and the coarse rock \$25. The same dike has been cut at the fifth level, but it has not been explored. In vein No. 2 three-fourths of the vein is pay. In the seventh level a wide body of ore runs as high as 40 to 150 ounces in silver and five ounces gold, and also some gray copper.

The following is cabled to London office of Stratton's Independence mine: No change as regards the character of the mine. Extracting the ore from bunches in the upper levels. Have several months of ore assuredly remaining in the upper levels with probability of finding other bunches of low-grade ore in ground abandoned by former owner. Very little doing on 1400-foot level owing to excessive influx water. Will resume explorations on that level on arrival large pump next month. On 1150-foot level ore continues spotted in character. The general average for distance of 250 feet does not exceed four pennyweights per ton for stopping width. Raises above this section show some improvement in value, not significant as yet.

At Cripple Creek, the lessees operating on the estate of the Anaconda Co., shipped 500 tons of ore in November. Of thirty-five leases from ten to fifteen are making a good showing. Superintendent D. Falvey has resumed work on the Burns shaft of the Acacia Co. and shipped thirty tons of ore recently, which returned \$50 per ton.

S. H. Guyot of Boston reports that he has sold the Black Wonder and M. C. lodes, on Bull hill, to a Boston syndicate for \$50,000. The properties adjoin the Vindicator, Theresa and Golden Cycle.

The gold production of Cripple Creek district for November was \$1,901,250, from 61,400 tons of ore, or about \$31 per ton.

A strike is reported in the Empire State mine at Cripple Creek. This property joins the Isabella, which two and a half years ago produced ore of phenomenal richness. It is supposed that this new strike is a part of the Isabella zone.

The War Eagle mine at Cripple Creek reports a new find at a depth of 60 feet in what is known as the Mud vein.

General Manager F. M. Woods reports a strike in the Deadwood shaft of the United Mines Co. at Cripple Creek. The vein is 40 inches in width.

Arrangements are being made to lease the Stratton estate properties in Cripple Creek. There have been a large number of applications.

Manager A. H. Heller of the Arequa mill and cyanide plant, near Cripple Creek, has bought the Wild Horse dump. The

estimated tonnage of the dump is 20,000 and the average value \$5.

Cripple Creek says the Black Wonder and N. C. claims on Bull hill have been sold to Boston men for \$50,000.—A 3-foot vein of ore has been opened in the Dexter claim on the west slope of Bull hill.

The Midox M. Co., operating the Atlanta of the Gilpin & Cripple Creek Co., shipped thirty tons of screenings that returns two ounces.

IDAHO.

ADA COUNTY.

The News says B. M. Baker of Salina, Kan., proposes to erect a 20-stamp custom mill and roasters at Boise.

BEAR LAKE COUNTY.

The Claire Copper Co. at Montpelier proposes to erect a smelter and treat ores also from the Copper King, the Duke and the Elk.

BLAINE COUNTY.

The Times says the Oswego mine, near Halley, will resume.

The Minnie Moore mine at Bellevue is working 100 men. Two carloads of ore are shipped daily.

BOISE COUNTY.

A 5-foot ledge of cobalt ore is reported in the breast of the lower tunnel in the Standard mine, at Quartzburg. A carload of concentrates shipped contains 8% copper, 6% cobalt and \$50 gold.

IDAHO COUNTY.

The Idaho-Comstock property, which has been idle for two years, is now in operation again with an increased force.

Neal says the Daisy mine is sold to the Western T. & G. Co. for \$225,000. A 10-stamp mill and concentrator is on the property.

Thunder Mountain reports the intention to put in a concentrator at the Wordenhoff group on South creek. A 10-stamp mill has already been ordered. The Dewey mill last week sent out a \$10,000 bar, the result of a seventeen days' run.

Elk City reports the owners of the Sherman property intend to put up a 20-stamp mill.—In the Buffalo Hump country, 26 miles from Elk, are five stamp mills in operation.

In the American Eagle at Elk City a raise is being driven from the lower tunnel. Work on the mill is being pushed.

Hogan Bros. have closed down their mine for the winter, being unable to obtain power for the mill. The water in the ditch became frozen. The ditch is 5 miles long and they began covering it too late in the season. The ore is low grade and is quarried, three miners being able to break enough ore for a 20-stamp mill crushing eighty tons daily.

R. Leggett of Butte et al. have taken a bond on the Pacific group. Five feet of ore has been opened up in the tunnel at a depth of 130 feet which assays \$10 a ton.

OWYHEE COUNTY.

The Bullion group of claims on Potosi mountain, near Silver City, have been bonded to J. E. Mosher, for \$40,000.

The south drift in Sinker tunnel, near Silver City, is said to be in Mahogany ground, with ore 7 feet wide, and assaying \$15 per ton.

SALT LAKE COUNTY.

Secretary Lamb, Silver King M. Co., Salt Lake, has posted the regular dividend of \$100,000, or 66 2/3 cents a share, payable December 10, an aggregate for the year of \$1,200,000.

SHOSHONE COUNTY.

It is estimated that 3000 men are working in the mines of the Cœur d'Alene. At Wardner, 1000; Canyon Creek—Tiger-Poorman, 50; Mammoth, 140; Hecla, 100; Standard, 245; and Frisco, 250; Mullan—Morning, 250; and Hunter, 50; at the California, up Nine Mile, 45; at the sampler below Wallace, 35; at the mines at Murray and Prospect, 400 (estimated); at Hercules, 50; and prospectors working their own claims throughout the district places the number at 3000.

The Frisco mine, at Gem, which has been idle for eighteen months, will resume operations in a few days with a force of 280 men. The Frisco will output 2000 tons of concentrates per month, the mill having a capacity of 850 tons of ore daily. There is enough ore blocked out for twelve months, and with new development work the ore reserve can be kept ahead of the mill's capacity.

The lower tunnel at the Reindeer, near Mullan, is in 300 feet and has 500 feet more to drift before cutting the ore shoot. The contract for 200 feet of tunnel on the Alice group in Reddy's gulch is completed, but work will be continued.

Manager A. M. Strode of the Stevens Peak M. Co., near Mullan, has so far met with good success. He is manager of the Stewart M. Co., operating in Government gulch, and also manager of Reindeer C. Co. The Stevens Peak property lies south of Mullan a short distance. Consid-

erable development work has been done on the property. At present the company is running a tunnel to tap the lead at a depth of 850 feet, and is now in 1500 feet, having another 100 feet to drive.

After four years of rock cutting the Bunker Hill & Sullivan Co. has connected every opening in its mines at Wardner, with the tunnel, the mouth of which is at the mill 2 miles below.

INDIAN TERRITORY.

CREEK NATION.

At Keystone, 20 miles west of Tulsa, a discovery of large deposit of zinc and lead has been made. Lahorers blasting on the Arkansas Valley & Western grade hlew the side off a bluff along the river and exposed a deposit 40 feet in thickness.

ILLINOIS.

POPE COUNTY.

The Empire lead and spar mines on the Illinois Central Railroad have shipped the first carload of zinc ore ever mined in the State of Illinois. This mine is on land owned by Mrs. William McKinley, and was operated by the Saxtons for several years after the Civil War for spar and lead, but they found so much carbonate of zinc that they abandoned it.

MICHIGAN.

HOUGHTON COUNTY.

The Michigan mine management has decided to build a mill. It has not been determined where will be the most advantageous place to locate the mill. The company has three sites—one on the river near the mine, another at Redridge and the other at Four Mile Rock, down the lake from Ontonagon. This latter place contains many good features and it is probable that the company may decide on this site.

Two of the three heads of the Adventure mill are crushing 400 tons of rock daily. A month has elapsed since stamping was begun, and already it has been necessary to take portions of the machinery of one head to replace damaged parts of others.

The death of T. H. Mason of New York, president of the Quincy M. Co., leaves the future management of that property in doubt. Since the death of the elder Mason, two years ago, the management has devolved upon W. R. Todd, who has made a number of innovations and has changed the personnel of the local staff. The Quincy is earning \$600,000 yearly.

A winze will be sunk on the lode from the bottom level of No. 2 shaft of the Tamarack, Jr., Houghton, to show character of lode up to Calumet & Hecla line without the expense of sinking a shaft and crosscutting. No. 1 shaft has been abandoned.

MONTANA.

BEAVERHEAD COUNTY.

The Tombstone M. Co. has bought two mining claims near Dewey, in the Dewey Flat district. The vein is gold bearing ore, assaying \$10 per ton. The 10-stamp mill will be enlarged. The ore is free milling.

DEER LODGE COUNTY.

Anaconda says the main shaft on the Ravin mine in Centerville is being sunk to the 500-foot level by the lessees. The Ravin rock is a copper-silver ore.

FERGUS COUNTY.

The Alder Gulch M. Co., near Lewistown, is cutting lumber for a cyanide mill. Two tunnels, 400 and 150 feet, are being driven.

The ditch that is being taken out by the Gold Reef M. Co. from the head of gulch to the Gold Reef mill, near Gilt Edge, will be completed this month. It is 3 1/2 miles long. Thirty men are at work.

FLATHEAD COUNTY.

Manager D. P. Bowers, the Rustler M. & M. Co., near Libby, says the company will build a branch line of 20 miles from the Snowshoe mine to connect with the Great Northern railroad.

GRANITE COUNTY.

C. F. Chapin, manager of the Sunday mine of the Montana G. M. Co., near Phillipsburg, is shipping ore to the smelter in Butte. The mill on the ground crushes only the low-grade rock, but it is the intention to install a plant to handle the entire product.

MADISON COUNTY.

The Norwegian mine, in Norwegian Gulch, has a vein of \$116 rock, 2 to 20 inches wide.

F. Field has finished cyaniding the tailings at the Easton mill, near Junction. His summer's work yielded three bars of bullion weighing 4730 ounces, with a high percentage of silver. He has installed a plant to work the rock of the mine during the winter.

The Daisy Bell mine, near Parrot, is reported bonded to Butte men.

M. Field of the Easton mine reports that he has the new cyanide plant nearly

completed. As there are several thousand tons it will take nearly a year to clean up the dump.

MISSOULA COUNTY.

The second payment on the Monitor-Richmond group, near Saltese, has been made. The claims are under bond to the Bitter Root C. M. Co. for \$200,000. Manager H. F. Welsh says \$50,000 has been spent in development since June last; forty men are at work. On the Monitor the shaft is down 200 feet on an ore body 15 feet wide, carrying 8% copper and \$5 gold. On the Richmond are four shafts, average 100 feet deep, opening the lode on its length 730 feet, which has ore containing 10% copper and \$6 gold. He expects to install an electric plant and a 200-ton matting furnace at Saltese in the spring.

PARK COUNTY.

Jardine says the Bear Gulch M. Co. has settled its litigation and negotiations are pending for a consolidation with the Gold King Co. and a sale to Chicago men. The ledges of the Bear Gulch have been opened to a depth of 1000 feet, and are wide, carrying an average value of \$15 per ton. Work is being pushed at the Yellowstone and the Crevasse in the same district.

The Revenue 40-stamp mill at Jardine is being altered. All of the vanners and concentrators are being taken out and extra plates substituted. The tailings will be saved and treated by the cyanide process.

SILVER BOW COUNTY.

The Travona mine, at Butte, has resumed, and will have the hoisting plant from the Mayflower, in Jefferson county.

Butte says Receiver W. E. Carroll, in the Nipper mining case, filed his report. He finds a number of discrepancies between the figures of Receiver Harris and the Montana Ore Purchasing Co., and that there is due the receivership from the Montana Ore Purchasing Co. the sum of \$15,502.77.

The tailings of the abandoned Parrot smelter, Butte, which were successfully worked over in a concentrator for some time, are being shipped for treatment to the Colorado smelter.

NEVADA.

ESMERALDA COUNTY.

The Red Mountain G. M. Co., at Silver Peak, has incorporated under the laws of Arizona; \$300,000; A. F. White is manager.

In the Paymaster mine, near Silver Peak, Manager J. L. Butler has opened up a 7-foot ledge of ore assaying \$10 a ton in gold.

HUMBOLDT COUNTY.

The Spring valley placers will be worked by hydraulicking.

The California-Nevada M. Co. has eight men at work on the Arizona mine at Unionville taking ore for trial shipment.

LINCOLN COUNTY.

The Manhattan M. Co. at Stampede Gap, near Pioche, are putting in a whim, also air pipes.

LYON COUNTY.

The Journal says work has been suspended in the North Rapidan tunnel at Como for lack of fuel to run the steam boilers, due to the condition of the wagon road to Dayton.

NYE COUNTY.

A new strike is reported on the 400 level of the Mizpah mine at Tonopah.

Sinking of the new shaft of the Montana-Tonopah continues at the rate of 5 feet per day, a depth of 300 feet having been reached. At the 400 a crosscut will be run in the porphyry lode to open the ledge.

President J. M. Burke of the Tonopah Extension M. Co., at Butler, says he will put in machinery to sink the shaft on the Grand Trunk claim to 1000 feet.

The Tonopah M. Co. is taking out ore from the 400-foot level of the Mizpah. It is proposed to build their own reduction works, says the Miner.

The Gold Hill Co. has installed a steam hoist and has resumed sinking.

The winze on the 230 level of the Ray & O'Brien is in an 18-inch shoot of ore averaging \$150 a ton. The drift on the 160 level is in 110 feet from the shaft, and an upraise is being driven into two shoots of ore.

Copper pyrites are found in the ledge at the bottom of the 250-foot incline shaft on the Silver Knight mine at Klundike, says the Bonanza. The country rocks are lime and quartzite, with a formation of shale lying between, the trend northeast and southwest.

At Butler development work in the group of mines of the Tonopah M. Co. is being pushed; the drifts on the Mizpah vein, 300-foot level, are in ore, the east drift is nearing the east end line of the Mizpah claim; the 400-foot level is being opened up by drifts east and west. There is no cropping on the surface on the east

end of the Mizpah claim as the ledges have been capped by a later flow of porphyry.

The south crosscut on the 240-foot level of the Valley View shaft cut a 9-foot vein recently and is expected to cut the main ledges of the Valley View claim. The stone foundation for the steel hoist and machinery building is completed.

The Bonanza says G. F. Hensel of Philadelphia has bought the Molly M. Co.'s claims and also the Tonopah Fraction Extension. The Tonopah T. & M. Co., the Tonopah Belmont M. Co. and the Acenth M. Co. have consolidated as the Tonopah Belmont Dev. Co., and bought the rights of the G. & H. tunnel, which operates through Mt. Oddie.

WASHOE COUNTY.

A. F. Sisson reports ore running \$25 per ton at the Belcher, at Olinghouse.

The No. 2 mine at Olinghouse is in low-grade ore on the south drift, 80-foot level. Superintendent Poole says the entire drift is in ore.

The Wadsworth Dispatch says that the Crown Point mine, under bond to Bell & Co., has been released. The last shots fired brought ore in both north and south drifts.

NEW MEXICO.

GRANT COUNTY.

Negotiations are under way for the erection of a smelter, with a capacity of 100 tons, at Silver City. No attempt will be made to utilize the plant which is now standing idle. The projectors have extensive interests in the county.

Manager L. P. Deming of the Alessandro C. Co., near Silver City, says he will put in a leaching plant for the treatment of the ore. The company owns the Jones and Gettysburg groups of twenty-two mining claims in the Burro Mt. district. The American C. Co. also intends to install a leaching plant.

LINCOLN COUNTY.

Nogal says the White Mountain G. M. & M. Co. is developing the Star Gem group in Cliff canyon. A 200-ton cyanide plant will be put up.

SANTA FE COUNTY.

The St. Lazarus mine, near San Pedro, has been sold under foreclosure of mechanics' liens.

The smelter at Cerrillos is treating copper ores exclusively, but it is the intention of the company to build the most complete plant for separating zinc and lead that can be obtained. The ores of the Cerrillos district contain equal parts of lead and zinc with silver. W. A. Brown of Franklin, Pa., who is financially interested in the smelter, is giving his personal attention to its operation.

OREGON.

BAKER COUNTY.

The management of the Blue Bird, at Red Boy, has changed its original plans. Owing to the good showing recently made in the crosscut in opening the third vein on the property, it is thought wise to defer the erection of a stamp mill until a later date. The ore body is of such dimensions as to justify a larger plant to handle the ore, and work is now in progress on a compressor plant. The preliminary work is being done. The plant will consist of a 6 drill compressor, 70 H. P. holler and large engine, with power drills. Work will at once begin on the necessary buildings to accommodate this machinery.

W. R. Crawford has bought a three-fourths interest in the Phoenix mine, near Baker City, for \$30,000.

GRANT COUNTY.

Near Granite the Bonanza Co. will sink another 200 feet to the 1000-foot level, and stopping on the upper levels will begin. A 10-stamp mill is being erected at the Virginia, in the Greenhorn district.

JACKSON COUNTY.

The Homestake mine, near Woodville, has been bonded to Eastern men for \$8000.

JOSEPHINE COUNTY.

The placers of the Waldo district have resumed. The Simmons mine has enlarged its plant. These mines get water from the Illinois river, which heads on the north slope of the Siskiyou. In Grave Creek district the giants have been turned on. Several of these placers have had extensive repairs and more pay dirt will be moved this season than ever before.

Grants Pass says the recently equipped Eureka mine of the Soldier Creek district has ore giving \$15 per ton free on the plates, sulphurets \$10 per ton. A 10-stamp mill is on the property. A wagon road is to be built from the main county road and a telephone line to connect with the Sunset Co.

MALHEUR COUNTY.

Superintendent R. M. Wilson, Red, White & Blue M. Co., says he will replace the present mill with six 1200-pound stamps.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Penobscot G. M. Co. is building a 40-stamp mill, provision being made that more stamps may be put in when desired. The first forty stamps will be started early in December and the work of adding ten stamps begun. There is room in the building for eighty stamps.

The report of State Mine Inspector T. Gregory for the first ten months of 1902 shows that during that time the Homestake mills crushed 1,218,069 tons of ore, which produced a gold value of \$4,303,977.57—equal to \$3.53 per ton.

The Spearfish G. M. Co. has made a discovery in relation to the ore bodies in the south end of the property. There is a second ore formation lying underneath the main blanket vein, separated from it by lime formation. In a tunnel on ore outcropping in Johnson gulch it was proved that the vein dipped into the hill and in following up this showing it was found that another ore body has been disclosed, which is 18 feet below the main vein.

The Pluma Co. at Lead is excavating at the Hawkeye mill for enlarging from forty to eighty stamps. The west cross-drift on the 300 level of the mine is developing ore.

The new cyanide mill of the Hidden Fortune Co. at Central, of sixty stamps, will be completed by January 1.

Forty stamps and a cyanide mill will be added to the Pluma G. M. Co.'s plant at Pluma.

A new shoot of ore has been discovered by the University G. M. Co., near Deadwood, in the South Dakota ground on Annie creek. Part of the body is an oxidized ore, adapted to cyaniding, the rest of it is a smelting ore.

PENNINGTON COUNTY.

The mining village of Rochford, 18 miles south of Deadwood, was completely destroyed by fire on the night of Nov. 28.

UTAH.

BEAVER COUNTY.

The Beaver Con. M. Co., near Milford, is putting in a 75 H. P. hoist and an air compressor.

The working tunnel on the old Hickory, at Milford, is in copper ore 158 feet from the mouth and a vertical depth of 80 feet. The ore has red and black oxides and sulphides. Foreman Price has twenty-one men at work and is enlarging the shaft to a double-compartment, and as soon as this is completed will resume sinking.

At Milford thirty-five men are at work on the Majestic smelter. The masonry is about done.

The returns to the Horn Silver mine of Frisco from a shipment to the smelter show 21.5% copper, 20% lead, six ounces silver and 60 cents gold per ton.

JUAB COUNTY.

Having found a market for its argentiferous iron ores at the furnaces of the Bingham Con. smelter, the management of the Swansea of Tintic has begun shipments, the contract with the smelter enabling it to ship 2000 tons per month. Of this class of ore the management reports 4000 tons in the bins, and steady shipments are assured pending the resumption of work underground.

At a depth of 1600 feet the Gemini M. Co. at Tintic has ore showing 3% copper, in addition to increase in gold values.

Manager J. W. McChrystal of the Eagle & Blue Bell at Tintic says that at the bottom of the winze, 400 feet below the 230-foot level, a vertical depth of 1250 feet below the surface, breast samples show \$60 in gold and 25% copper.

The Little Chief, Eureka, has levied an assessment of 1 cent per share.

The Utah mine at Fish Springs has declared a dividend of 2 cents a share, or \$2000.

SALT LAKE COUNTY.

At Bingham Superintendent W. J. Craig of the Tintic M. & D. Co. says he has cut the vein in the Yampa at 2300 feet in the lower tunnel. The vein is 25 feet between walls and assays \$5.60 gold, 4% copper and a few ounces silver. To connect with the workings above there is 1000 feet of ore through which to raise. A smelter is proposed.

Salt Lake reports that the tunnel being driven to drain the Dalton & Lark has tapped the water in the old workings.

Salt Lake says the annual report of the Dexter-Tuscarora by G. E. Airis, secretary, shows a gross yield during the year of \$130,000, profit of \$23,000, derived from 30,090 tons of ore at \$7.12½ per ton. An extraction of \$4.77½ was made at a cost of \$4.59 for mining, milling and development work.

The Dewey mill, Bingham Canyon, is handling ores of the Sampson M. Co. and has returned the fourth lot of concentrates. The tonnage is increasing so that

an addition will be made to the mill in the spring.

SEVIER COUNTY.

Richfield reports a strike in the B. W. & H. claims in the Gold Mountain district at a point 267 feet above tunnel No. 2, and it seems to be the principal vein. Superintendent J. Billingsly is driving a crosscut to find its width.

SUMMIT COUNTY.

Near Park City, the Scottish Chief M. Co. has bought the Insley Co.'s claims, installed a gasoline hoist, and are down 150 feet in the shaft. Fifteen men are at work.

The plant of the Mackintosh sampler at Park City is in operation, and has a capacity of fifty tons per hour.

Park City says Loring Bros. have closed down their concentrator for the winter. Electrical machinery is being installed at the zinc plant.

A strike is reported at the Nalldriver, near Park City, made by the graders while excavating for the boarding house, and consists of a vein of carbonate ore 1 foot in width. The ore returned fifty ounces of silver per ton from the surface.

Superintendent McSorley of the Daly-Judge reports the management has been opening its Bonanza ground in ore for days, no effort being made to stop, and that for forty-eight hours but a single mine car of waste was run out. Some of this ore carries 60% lead, with fifty ounces silver.

TOOELE COUNTY.

Metallurgist Colbeth, Con. Mercur M. Co., returned from the testing of a car of Con. Mercur ore by the Pohle-Crossdale Co. of Denver, says of the tests: The Pohle-Crossdale volatilization process consists in a chloridizing roast and then bringing the ore to such a degree of heat that chlorides are volatilized. The recovery apparatus is an expansion chamber and gravel tower where the fumes are cooled; this chamber varying according to the amount of salt used and of fumes to expand; built of brick and lined with glazed tiling to prevent absorption by the bricks. The fumes pass from upper end of chamber through horizontal iron pipes (common boiler stacks used) to bottom of gravel tower; fumes have no action on iron pipe while kept warm and dry. The gravel tower has a 4-inch layer of coarse gravel, with spray of water on it; water drawn off through filter and gold or silver chloride and lead sulphates partly recovered; gravel is used to break up bubbles of gas. From gravel tower fumes pass through gas exhaust pan into filter tower, through four burlap filters, each a spray of water on it, then fumes pass up stack and out; water from sprays on hurlaps passes through same process as from gravel tower.

WASHINGTON COUNTY.

Manager G. Snyder of the Dixie mines, near St. George, is placing the machinery for the smelter.—At the Paymaster, prospected under an \$80,000 option by A. J. Mallory et al., drifting is in progress from two levels in the shaft.

WASHINGTON.

COWLITZ COUNTY.

The Arnold M. & M. Co. of Kalama is incorporated; \$1,000,000; F. W. and S. Arnold, H. M. Stevens, G. Gassin. A shaft will be sunk on the company's ledge, 1500 feet north of the Darnell mine.

FERRY COUNTY.

Near Republic Superintendent Angus at the Quip is sinking from the 400-foot level. A crosscut is being driven from the bottom of the shaft to intersect the vein. Thirty-two men are at work.

The Pioneer-Miner says the Republic Placer Co. has bought the Falls and Little Falls claims on Granite creek.

S. P. Damer, general manager at Republic of the Ben Hur G. M. Co., reports that the Ben Hur will work through the Trade Dollar shaft and its 200 and 300 levels. The Trade Dollar will be unwatered by Superintendent G. N. Miller. The Ben Hur takes possession of Trade Dollar machinery and workings. The term of the agreement is one year. The Trade Dollar Co. drove the south drift to the boundary of the Ben Hur, the last 19 feet being on a payshoot which strikes into the Ben Hur. On the 300 level the payshoot is 19 feet from the end line.

Superintendent Angus says since work was resumed on the Quip, at Republic, in October, 1300 tons of ore have been shipped to the smelter, having an average value of \$23 per ton. At present no stopping is being done beyond breaking ore in the winze and in upraising to make connections between the levels. Five levels have been opened, the fourth level showing 125 linear feet of the pay shoot. An 8 H. P. engine will be installed on the fourth level to hoist out of the winze that is being sunk on the pay shoot.

SNOHOMISH COUNTY.

The Libbey tunnel, near Index, is in 160 feet, the last 20 feet in ore 4½ feet wide,

showing chalcopryrite and arsenopyrite. J. Carignan and J. Spada are the owners.

SPOKANE COUNTY.

The old Spokane smelter has been revived and is in the hands of a new company, which proposes to commence business as soon as their plans for the remodeling of the plant are complete. Mr. Van Ossel, metallurgist of the company, was through the Kootenays recently with a view to looking over the country and conducting preliminary arrangements for the purchase of British Columbia lead ores.

THURSTON COUNTY.

President H. G. Longee of the Great Western C. D. & M. Co. says they have 2000 acres of coal lands near Tenino. There are four flat veins aggregating 20 feet thick, but as yet only the top seam of 4 feet is being stoped. Aspur will be built from the property 2½ miles to connect with the N. P. and the Port Townsend & Southern railroads, giving a haul of 15 miles to Olympia. Two bunkers have been erected at the mine.

WYOMING.

CARBON COUNTY.

M. M. Green, part owner of the Rambler mine, was in Saratoga a few days ago to arrange for enlargement of the Rambler smelter fifty tons daily capacity. The capacity of the plant at present is 100 tons.

SHERIDAN COUNTY.

The Galena Ridge M. Co., with the following officers, has been organized at Lead City, S. D.: T. J. Grier, president; E. May, vice-president; C. Kellar, secretary; R. H. Driscoll, treasurer; H. Schnitzel, superintendent; C. W. Merrill, consulting engineer; G. W. Holdredge, B. Moody. The company will operate in the Big Horn country.

FOREIGN.

BRITISH COLUMBIA.

The Tacoma Smelter Co. has sued the Lenora M. Co. of Vancouver island for \$25,000 for breach of contract, alleging failure to furnish a stated amount of ore. At the solicitation of other creditors, Judge Drake at Victoria has appointed a liquidator who will take charge of the property in the interest of creditors.

Manager T. Kiddie, Tyee smelter at Ladysmith, is installing the boilers and machinery for the plant, and expects to blow in this month. The aerial tramway from the Tyee mine to Westholme is moving ore for the sampling works and roast heaps, so that when the smelter starts there will be material to work on.

Manager J. H. Mackenzie, Le Rol mine, and Northport smelter, says the cost of smelting at Northport averaged for November, with three furnaces running, about \$3.50 a ton. During October the cost was \$3.89 a ton, with coke \$9.25 a ton. Now they are getting coke from Crow's Nest fields, at \$7.75 a ton. A fourth furnace will be installed, which will reduce the cost to \$3 a ton. The practice of using calcining furnaces to bring up the grade of matte has been resumed, making a matte running 48% in copper and slag losses less than formerly. The average of the matte was 40% and was run through blast furnaces two or three times, with a loss of copper in slag each time. The charge of limerock, formerly 41%, is now 27%.

Rosland says the Cariboo-McKinney M. Co., of Camp McKinney, has declared a dividend of 2½ cents a share, payable December 15.

Manager Kirby's annual report of the Centre Star M. Co., near Rosland, shows ore sales during the year 11,086 tons, averaging gross values \$16.24 and gross smelter values \$13.31. Cost of development \$172,552; diamond drilling \$8571.27. Ore contents averaged gold .64 ounce, silver .56 ounce, copper 1.2%. The development work for the year was as follows: Main shaft, 362 feet, cost per foot \$95.15; winzes, 50.5 feet at \$45.22 per foot; raises, 153 feet at \$33.21 per foot; drifting, 3997.5 feet at \$21.93 per foot; a total of 4563 feet development for the year. The cost of stoping was \$2.93 per ton. A mill and concentrator will be erected.

The British Columbia Government has issued a report on the mining situation which shows a promising outlook in the mines of that district. The estimated general output of that province has increased from 20% to 25% over that of last year.

At Fife, on Christiana lake, the Trill smelter has leased the lime quarries of T. Price for ten years.

At the Snowshoe mine, near Phoenix, work is being pushed on the new gallows-frame, and the ore bins, which will have a capacity of 3000 tons—75 feet long, 52 feet high, 20 feet wide; seventy men are at work, and 150 tons of ore daily are shipped to the smelter.

Fort Steele says the Kootenay Placer M. Co., on Perry creek, expect to have their dredger in operation next week. The

placer mines on Wild Horse creek have finished their cleanup. The yield exceeds that of 1901.

The Ladysmith smelter at Vancouver Island will be blown in next week.

Near Ferguson, Manager E. G. Haddow, Great Western M. Co., has forty men at the Nettie L. The Silver Cup has thirty men at work.

Lardeau's mining record office has been removed to Camborne.

Five tons of Hampton ore from the Slocan returned 1883 ounces of silver to the tons at the smelter.

The Le Rol made a profit of \$68,617 for November and cleared \$417,686 for the last five months.

The 100 H. P. dynamo, which will be used to drive the ore crusher at the Knob Hill mine, is being set up. The 700 H. P. dynamo, to drive the air compressor, will arrive next month.

Phoenix says ore shipments from the mines of the Boundary last week were: Granby mines, 4620 tons; Snowshoe, 1410; Mother Lode, 4320; B. C., 660; Sunset, 500; Emma, 690; total for the week, 12,200; total for the year to date, 445,655.

Grand Forks says Republic ore shipments to the smelter last week were as follows: Qulp, 322 tons; Morning Glory, 31; Lone Pine-Surprise, 118; total to date, 2966 tons.

Slaking is resumed at the White Bear mine near Rosland. Drifts will be run at the 900 to open up ore crosscut on the 700.

The owners of the Providence mine, near Greenwood, have received \$2887, net proceeds of a car of ore containing 40,910 pounds gross shipped to the Trail smelter. This gives \$130 per ton, net.

A smelter is projected at Golden by the Laborers' Co-operative G. S. & C. M. Co. of British Columbia. While it is designed to handle the ores mined by the company, custom ores will also be treated.

The Cork mine, near Kaslo, will ship ore; 1200 feet of crosscutting is being done and water power developed preparatory to building an electric plant.

The Fog Horn mine, in Ymir district, owned by the Golden Monarch Co. of Spokane, Wash., will ship 500 tons of ore which will average about \$25. The road from Ymir to the mine is completed, and as soon as the snow is deep enough shipments will begin. It is the intention of the company to erect a concentrator, compressor plant and aerial tramway in the spring.

Sandon says the electric drills at the Payne have been discarded. The Ophir-Lode Syndicate will install a 10-stamp mill on their Lardeau property.

The Highland mine at Ainsworth is shipping concentrates. B. Cortiana has a lease on the property.

The Nickel Plate mine, Similkameen district, is erecting a 40-stamp mill, and when railway connections are secured will put up a smelter.

The New Fairview M. Co., at Fairview, intend to sink the shaft 100 feet deeper. The cyanide plant will be in operation this month. The main tanks are 36 feet in diameter, 10 feet deep and will hold 200 tons of tallings.

Sandon says the Bayonne mine at the head of Summit creek has been bonded to B. N. White for \$50,000, the first payment \$5000. A trail has been built in from the landing on the Kootenay river to the group by the government.

A bessemerizing plant will be added to the British Columbia C. M. Co.'s Greenwood smelter.

Placer fields have been discovered on the fork of the Salmon river, near Erie, 30 miles south of Nelson.

The power line of the Cascade Power Co., near Grand Forks, is in operation.

The Miners says C. W. Mortimer, British Vice-Consul at Los Angeles, Cal., has bought ten acres of land ½ mile south of Grand Forks, and will install a drilling plant to bore for oil.

In the Ottawa, No. 3 drift is in the ore body 70 feet. Two carloads of ore have been taken out in drifting, no stoping being done; 800 sacks await shipping; of this amount 100 tons is high grade, which will return 500 ounces silver; the remainder is the general filling of the ore shoot and will run 100 ounces.

In the Meteor the vein has been found in the lower crosscut. The ore body is 6 inches wide. The lessees will commence stoping and make a shipment.

The pay streak on the Legal, on the North Fork of Lemon creek, has been struck in the lower tunnel. The pay is 10 inches wide and assays \$64 gold. Work will be suspended until next summer, when cars and track will be put in.

The owners of the Vancouver group, in Aspen Grove, Similkameen country, have opened a large body of copper. The pay is 40 feet in width and extends through the group. Recently samples from an 18-inch seam assayed 2.20 ounces silver, \$2.80 gold and 55.04% copper; and 1.90 ounce silver, \$2.32 gold and 18.04% copper. A sample from the remaining portion of the full width of the pay streak

gave 5.20 ounces silver, \$1.60 gold and 6.03% copper.

Recently an adjoining group was sold to Indianapolis people for \$100,000, and the Sovereign group, on the same hill, was sold to Indianapolis capitalists for \$75,000.

KLONDIKE.

Dawson says a flow of water from a mine shaft on El Dorado creek has caused concern. Miners have been sinking the shaft through several layers of gold-bearing sand and loose rock, expecting to get to bedrock. When down 210 feet water rose in the shaft, filling it in six hours, then overflowed and run through Bonanza Camp, damaging mining machinery and small buildings. The stream contained 500 miners' inches and carried white sand out with it. Beaudette, the Government engineer, will try to control the flow.

Personal.

J. L. HARRIS is superintendent Quincy, Houghton, Mich.

F. G. ROSE is manager the Duke M. Co., Montpelier, Idaho.

J. EVANS is superintendent of the New Home M. Co., Leadville, Colo.

J. G. KEPPLER has returned to Kingman, Ariz., from Nacozari, Mexico.

W. L. VINSON, manager Emma mine, Virtue district, Oregon, is in the East.

W. C. HOWARD, owner of mines at Hayden Hill, Cal., is in San Francisco, Cal.

W. H. GENDER is superintendent of the Trilune mine and tram, Ferguson, B. C.

JOHN PARR, a mining operator of Bodie, Cal., is inspecting mines at Tonopah, Nev.

H. H. HUNTER of Salt Lake City, Utah, is examining mining property near Elko, Nev.

F. W. HARTMAN is chief mining engineer of the Wolverine, Houghton, Mich.

I. S. WEAVER of Baltimore, Md., is superintendent Oswego mine at Hailey, Idaho.

A. M. STRODE is manager of the Stevens Peak Copper M. Co., near Mullan, Idaho.

GEO. A. PACKARD of Boston has made a report on the Monte gold mine, Baker City, Or.

F. LINSOTT is superintendent of the New York mine, Greenville, Plumas county, Cal.

CHAS. HUFF is manager the Calbre Copper Co., Montpelier, Idaho, vice F. G. Rose, resigned.

JOHN EVANS has been appointed superintendent of the New Home M. Co., at Leadville, Colo.

L. E. BOYER succeeds P. Creasor as superintendent of the Lone Pine mine, Republic, Wash.

C. O. BARNES is manager for the Curlew and the Trade Dollar G. M. Co.'s at Republic, Wash.

R. B. TURNER, superintendent of the Kennett mines at Virginia, Mont., is in Butte City, Mont.

PRESIDENT D. KEITH of the Silver King, has returned to Park City, Utah, from Portland, Or.

ABBOT A. HANKS of San Francisco has returned from examining mining property near Tonopah, Nev.

W. M. NESBIT has returned to Tintic, Utah, from an examination of mining property in Colorado.

T. S. HUDDLESTON, superintendent of the Galena King mine at Stockton, Utah, is in Salt Lake, Utah.

MANAGER W. M. BROOK, Con. Spruce Creek Placer Co., Ltd., Atlin, B. C., has returned from Vancouver.

C. L. HANSEN AND A. S. PARKER of Los Angeles, of the Tonopah & California M. Co., are at Tonopah, Nev.

L. P. DEMING has returned to Silver City, N. M., from a trip East on business for the Alessandro Copper Co.

W. L. SAUNDERS, vice-president of the Ingersoll-Sargeant Drill Co. of New York, was in Butte, Mont., last week.

J. M. BURKE, president of the Tonopah Extension M. Co., Butler, Nev., is in San Francisco on company business.

MANAGER C. O'KEEFE of the Sonora M. & M. Co., Phoenix, Ariz., has gone to New York on company business.

MANAGER M. R. HUNT has been making an examination of the Bingham & Eastern Co.'s property at Bingham.

G. A. NIELL is superintendent of the

New Independence mine, near Nevada City, Cal., vice C. M. Root, resigned.

MANAGER C. I. RADER of the Annie Laurie, near Salt Lake, is in Chicago, attending a meeting of shareholders.

MANAGER T. S. IRVIN, the American mine, French Gulch, Shasta county, Cal., has returned from San Francisco, Cal.

SUPERINTENDENT W. J. BELCHER, the White Bear mine, Downsville, Cal., has returned from San Francisco, Cal.

E. S. McDOWALL, mine and mill accountant, formerly at De Lamar, Nev., is with the Majestic Co., at Milford, Utah.

SUPERINTENDENT C. H. DUNTON of the Eureka slate quarry at Kelsey, Cal., has returned from a five weeks' visit East.

F. B. JOHNSON, former manager of the Stratton mining interests in Cripple Creek, has returned to Georgetown, Colo.

SUPERINTENDENT R. M. WILSON of the Red, White and Blue mine, Malheur City, Or., has returned from San Francisco.

MANAGER N. TREWEEK of the Big Cottonwood C. & G. Co., Park City, Utah, has gone East on business for the company.

A. DIBBLE, superintendent of the Daniel Webster quartz mine, near Michigan Bluff, Cal., has returned there from San Francisco, Cal.

W. F. SNYDER, president and manager Western Exploration Co., Salt Lake City, Utah, has gone to California to inspect mining properties.

A. J. DORAN of Kingman, Ariz., is making an examination of the Walters mine and mill, on the Santa Maria river, Yavapai county, Ariz.

W. R. THOMAS, superintendent of the Central Eureka mine, Sutter Creek, Cal., is at Berkeley, Cal., where he is recovering from a severe illness.

B. B. THAYER, superintendent for the Santa Rita M. Co. of Santa Rita, N. M., has gone to New York City on business, to be absent three weeks.

W. E. DOWNS, C. E., of Sutter Creek, Cal., is in San Francisco, Cal., on business. Mr. Downs is engineer for several mining companies in Amador county.

MANAGER J. H. MACKENZIE of the Le Rol, B. C., mine and Northport, Wash., smelter, has returned to Northport from a business trip to Spokane, Wash.

P. E. MURRAY, superintendent Zubiata mine, Sonora, Mexico, who had been in San Francisco, Cal., purchasing machinery for his company, has returned to the mine.

VICE-PRESIDENT O. J. FARNSWORTH AND MANAGER J. C. LOSS of the Bonanza G. M. & S. Co. of Leavenworth, Kan., are at the company's works near Casa Grande, Ariz.

W. H. LINNEY has resigned the superintendency of the De Lamar, Nev., mines, being succeeded by F. A. Keith, and F. P. Janney has been appointed general superintendent. D. L. Davis assumes the position of engineer, succeeding Mr. Keith.

C. M. BELSHAW, president of the California Miners' Association, announces the following committees for the ensuing year: Executive Committee at Large—J. H. Neff, chairman; E. C. Voorhies, W. C. Ralston, Harold T. Power, John F. Davis, A. Caminetti, Tiley L. Ford, W. W. Montague, Charles G. Yale, Edward Coleman, Andrew Carrigan, Mark B. Kerr, J. S. McBride, J. J. Crawford, B. N. Shoecraft, C. C. Bush, Dr. C. T. Deane, David McClure Jr., J. W. C. Maxwell, E. A. Belcher, J. F. Halloran, John McMurry, W. S. Keyes, W. H. McClintock, Dan T. Cole, George H. Wallis, F. F. Thomas, Frank R. Wehe, Julian Sonntag, Fred Bradley, W. P. Hammon, J. O. Harron, John M. Wright. County Executive Committee—Alameda, Professor S. B. Christy, Frank A. Leach; Amador, J. F. Parks, J. B. Tregloan; Butte, A. Ekman, Frank Griffin; Calaveras, A. I. McSorley, F. J. Solinsky; El Dorado, Thomas Clark, H. E. Pickett; Fresno, A. R. Briggs, W. H. McKenzle; Kern, John Treadwell, B. F. Brooks; Mariposa, C. C. Derby, A. H. Ward; Mono, R. T. Pierce, R. H. Turner; Nevada, A. D. Foote, W. F. Englebright; Northern California, Lewis T. Wright, H. W. Turner, W. I. Hupp Jr.; Placer, William Nichols Jr., W. S. Graham; Plumas, George Standart, U. S. Webb; Sacramento, J. H. Batcher, A. C. Hinkson; Santa Clara, Eillard W. Carson; Thomas Derby; San Francisco, Louis Glass, Arthur C. Bates; Shasta, Fred Hurst, W. J. Gillespie; Sierra, W. I. Redding, George F. Taylor; Southern California, H. Z. Osborne, Theodore B. Comstock, F. W. Braun; Tuolumne, Fred Sutton, A. C. Morrison; Yuba, W. B. Meek, F. K. Lord; Sonoma,

C. A. Grimmer, Alfred Abbey. Committee on Finance—Andrew Carrigan, chairman; Joseph Sloss, J. O. Harron. Committee on Legislation—John F. Davis, chairman; W. B. Lardner, J. R. Tyrrell, W. C. Ralston, F. S. Moody, A. E. Muenster, R. C. Rust. Committee on Mineral Lands and Conservation of Water—E. C. Voorhies, chairman; Marion DeVries, A. D. Foote, H. E. Pickett, B. S. Reector. Committee on Department of Mines and Mining—W. C. Ralston, R. G. Lukens, Threy L. Ford, C. H. Dunton.

Commercial Paragraphs.

FAIRBANKS, MORSE & CO., Denver, Colo., have received orders for one 34 H. P. gasoline hoist for California, two 34 H. P. and three 22 H. P. gasoline hoists for Clear Creek and Gilpin counties, Colo.

THE Paraffine Paint Co. of San Francisco, Cal., is getting ready to vacate its old quarters at 116 Battery St., to occupy its fine new building on Second St., which will afford better facilities for its increasing business.

THE H. E. Skinner Co., San Francisco, Cal., dealers in firearms, ammunition, sporting goods, etc., have removed to the Flood building, No. 801 Market street, San Francisco, Cal., corner of Fourth, with a large stock of their special lines.

THE American Steel & Wire Co. has for some months been building bigger and better quarters at the newly acquired site, Folsom and Sixteenth streets, San Francisco, Cal., and has moved the general offices there from the old Pine street location.

THE old and well-known firm of Jno. Taylor & Co., San Francisco, Cal., dealers in assayers' supplies, chemicals, etc., which was established in 1849, has been absorbed by the enterprising firm of F. W. Braun & Co. of Los Angeles, Cal., who will take possession of their new acquisition Jan. 1, 1903.

THE district office managers of the Westinghouse Electric & Mfg. Co., representing all the principal cities of the United States, have spent the past week in their usual annual visit to the works and offices of that company at East Pittsburgh. On the evening of November 19 a very enjoyable dinner in honor of the visitors was given at the Duquesne Club, at which the engineers and executive officers of the company were also present.

Catalogues Received.

"Concentration Mills and Machinery" is the subject of Catalogue No. 7-B of the Colorado Iron Works Co., Denver, Colo., elaborately illustrating and describing some of that company's specialties, improved standard rolls, impact screens, Bartlett concentrators, hydraulic classifiers, etc.

Obituary.

W. C. REYNOLDS, mining engineer, employed by Marshall Field and the Pullman Co., died in San Francisco, Cal., Nov. 27.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

- FOR THE WEEK ENDING NOVEMBER 25, 1902.
- 714,631.—**AIR BRAKES**—E. M. Barnes, Sacramento, Cal.
- 714,357.—**CONVEYER**—H. W. Blaisdell, Yuma, Ariz.
- 714,633.—**DINNER PAIL**—J. T. Bluff, Seattle, Wash.
- 714,273.—**CONVEYER**—M. Bradfield, Los Angeles, Cal.
- 714,278.—**CONVEYER**—M. Bradfield, Los Angeles, Cal.
- 714,140.—**HAND TRUCK**—E. J. Bryan, Riverside, Cal.
- 714,449.—**CONVEYER**—G. C. Carson, Redding, Cal.
- 714,450.—**TREATING METAL**—G. C. Carson, Redding, Cal.
- 714,451.—**CONVEYER**—G. C. Carson, Redding, Cal.
- 714,287.—**HOD**—J. Dorey, Seattle, Wash.
- 714,467.—**OIL BURNER**—M. A. Fesier, Visalia, Cal.
- 714,180.—**ENGINE**—C. Hendricks, Riverside, Cal.
- 714,374.—**MOP WRINGER**—W. W. M. Hickey, S. F.
- 714,375.—**BED COUCH**—J. Hoey, S. F.
- 714,307.—**SUSPENDERS**—A. N. Johnson, Seattle, Wash.
- 714,373.—**ROTARY HARROW**—H. F. Jurs, Benicia, Cal.
- 714,585.—**FAUCET**—A. J. Ketelsen, Seattle, Wash.
- 714,587.—**COIN APPARATUS**—G. F. Lehrke, S. F.
- 714,203.—**GRAIN ELEVATOR**—Levy & Anderson, Liberty, Ariz.
- 714,385.—**BAG MACHINE**—J. V. Matteson, S. F.
- 714,316.—**MUSIC CHART**—C. T. Meredith, San Diego, Cal.
- 714,394.—**OIL BURNER**—Pfeiffer & Staples, S. F.
- 714,337.—**OILER**—G. W. Thurston, Kern, Cal.
- 714,539.—**SEALING JARS**—W. Walter, Shelton, Wash.
- 714,339.—**STILL**—Warren & Healy, Fort Thomas, Ariz.
- 714,416.—**PUMP**—A. W. Weaver, El Verano, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOP WRINGERS.—No. 714,374. Nov. 25, 1902. W. W. M. Hickey, San Francisco, Cal. The object of this invention is to provide a simple labor-saving device for wringing the mop cloth. It consists of a handle having suitable clamps means to engage the ends of the folded mop cloth, a sleeve slidable on the handle, means for locking the sleeve thereon, a hovel gear loosely turnable on said sleeve, a rectangular frame carried by said hovel gear and having its end enclosed by the cloth, and means upon the sleeve by which the cloth gear and frame may be rotated about the handle as an axis.

OIL BURNER.—No. 714,394. Nov. 25, 1902. L. A. Pfeiffer and L. D. Staples, San Francisco, Cal. The object of this invention is to construct an apparatus for the burning of hydrocarbon oils, and preferably for crude or unrefined oil, by the use of concentric tubes, into the inner one of which the oil is admitted and into the outer surround one of which steam is admitted, so as to heat the oil and to retain the steam under boiler pressure in the chamber which encloses the one through which the oil flows, and also to mix the steam and oil at this high temperature, and deliver the two eventually through the burner nozzle. Within the inner tube is a longitudinal movable rod having a valve at its front end which controls the discharge of oil, while said inner tube is in itself movable and has its front end so formed as to control the discharge of the steam into the mixing chamber, where it unites with the oil.

BEN COUCH.—No. 714,375. Nov. 25, 1902. John Hory, San Francisco, Cal. This invention is designed as an improvement on that class of couches having a hollow box or base adapted to contain bed clothing and the like, a seat frame hinged to the rear portion of the base and a back turnable supported from the seat portion having legs and braces for said legs, which, when folded up into the back, serve as a support to hold the back in its upright position. When unfolded, the braces extend the legs so as to support the back in a horizontal position substantially level with the seat portion, both being upholstered. This invention consists in more perfectly hinging the seat and back portion upon the box by hinging the seat portion of the base at a point between the front and rear of the latter and in forming slots and braces connected with the legs so arranged and adapted to operate as to form a strong and immovable support when the couch is opened up.

PUMP.—No. 714,416. Nov. 25, 1902. A. W. Weaver, El Verano, Cal. This invention relates to a novel pump and means for operating the same. It consists of two parallel pistons, piston rods connected therewith and means for operating said pistons consisting of double cam grooves crossing each other and having a switch or intersection, said switch including a movable tongue pivoted in the crossing of the cam grooves and a switch lever connected with the tongue and pivoted at substantially the point where the cam grooves come together. There is a centrally pivoted oscillating arm with the ends of which the piston rods are connected, and an arm extending at right angles from the first named arm and engaging with the groove of the cam; said arm acts to throw the switch at each approach of the crossing points of the cam grooves whereby said grooves are alternately opened to the passage of the arm.

ROTARY HARROW.—No. 714,378. Nov. 25, 1902. H. F. Jurs, Benicia, Cal. Assigned to Baker & Hamilton of San Francisco, Cal., a corporation. The object of this invention is to provide a device which will be much stronger than such harrows ordinarily are, and which will also be simple and economical of construction and which may be operated around trees and vines without injuring the bark of the latter. It consists in the combination of a circular revoluble toothed frame having forked or substantially Y-shaped spokes, a novel means of securing the teeth to the frame, and a projecting cushion on the frame, whereby the metal thereof is prevented from coming in contact with trees and the like.

Latest Market Reports.

SAN FRANCISCO, Dec. 5, 1902.

METALS.

SILVER.—Per oz., Troy: London, 21½d (standard ounce, 925 fine); New York, bar silver, 47½c; refined (1000 fine); San Francisco, 47½c; Mexican dollars, 37c San Francisco, 37½c New York.

COPPER.—New York: Standard, \$10.50@10.75; Lake, 1 to 3 casks, \$11.50; carload lots, \$11.30; Electrolytic, 1 to 3 casks, \$11.37½; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.35; carload lots, \$11.10. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £50 10s 0d spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½; pig, \$4.75. London: £10 12s 6d per ton.

SPELTER.—New York, \$5.25; St. Louis, \$4.50; London, £19 17s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 93c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$24.50; San Francisco, ton lots, 27c; 500 lbs., 27c; 200 lbs., 27½c; less, 28c; bar tin, \$32½c. London, £112 17s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 30c; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$48.00 large lots; London, £8 15s; San Fran-

cisco, local, \$46.00 @ flask of 76½ lbs.; Denver, \$49.50. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 90% pure ingots, 35c; No. 2, 90%, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.10c.

NICKEL.—New York, 50@60c @ ½ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$24.25; gray forge, \$21.15; San Francisco, bar, 3c @ ½ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.50 and \$31; open hearth billets, \$32 and \$34.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.90; K. B. & S., \$3.00; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$3.25 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$5.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c @ set; 14 oz., 40s., 9½c.

COAL.—San Francisco, coast, yard prices: Wellington, \$3.50; Seattle, \$3.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Canaan, \$9.00; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c @ ½ lb.; carloads, 24@24½c; in 10-lb. tins, 35c; sulphuric acid, in carboys, 66½ B, 2c @ ½ lb.; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½@3c @ ½ lb.; blue vitriol, 5½@6c @ ½ lb.; borax, concentrated, 7@8c @ ½ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½c @ 3½c; California refined, 2@2½c; nitric acid, in carboys, 8c @ ½ lb.; caustic soda, in drums, 3@4c @ ½ lb.; Cal. s. soda, bbls., \$1.25 @1.50 @ 100 lbs.; sks, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash,

in bbls, 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c @ ½ lb.

OILS.—Lined, bbls., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; lots of 5 bbls., 1c less; Lucol oil, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 21½c; Astral, 21½c; Star, 21½c; Extra Star, 24c; Ecocene, 23½c; Elaine, 26½c; Water White, in bulk, 15c; Mineral Seal, iron bbls., 19c; wooden bbls., 22½c; cs., 25c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 88° Gasoline, bulk, 21c; do., cs., 27½c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½c; Lard Oil, No. 1 bbl., 95c; cs., \$1.00; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 55@57½c; cs., 57½@60c; Sperm, crude, 50c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 52½c.

WHITE LEAD.—For lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c @ ½ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, ½ lb., 60c.

MANGANESE.—(90% and over) ½ lb., \$1.25.

MERCURY.—Bichloride, ½ lb., 90c.

MOLYBDENUM.—25c. ½ gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) ½ lb., 80c.

SILVER.—Chloride, ½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, ½ lb., \$1.00.

URANIUM.—Oxide, ½ lb., \$3.50.

ZINC.—Metallic, chemically pure, ½ lb., 50c.

ZINC.—Dust, ½ lb., 10c.

ZINC.—Sulphate, ½ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

Experienced Metallurgical Chemist who has operated lead and copper blast furnaces wishes position. Address "Geary," this office.

Experienced assayer, mine surveyor and chlorinator wishes position in any capacity at mine or mill. Address "Auburn," this office.

Cyanide Chemist wants position. Amalgamator and assayer. Graduate School of Mines. First-class references. Address "Cyanide," this office.

Superintendent, competent assayer, chemist and surveyor, experienced in development work, wishes position in any capacity. "Seattle," this office.

Cyanide man and assayer wants position. Can take shift on mill if needed. Practical experience and reliable. C. F., Mining and Scientific Press.

Engineer wants position to run hoist or mill engine or pump. Use to combustion of oil and Corliss engines. Have recommended. Good mechanic. R. Blackwell, Elsinore, Riverside Co., Cal.

Mining Engineer with twelve years' practical experience in mines and mills wants position as superintendent. School of Mines graduate. Has had extensive experience in developing prospects into shape for actual working on a large scale. Also practical cyanide manager, assayer and surveyor. Address "Engineer," this office.

Wanted, position as manager or superintendent of mining property, or would accept a position as consulting engineer. Have had over thirty years' experience and can refer to some of the best known people, both on this coast and in the East. Salary not so much an object as permanent employment. Address "Mine Superintendent," care of Mining and Scientific Press, 330 Market St., San Francisco, Cal.

Bookkeeper and Accountant, American, 29 years of age, desires position with first-class mining company in United States or Mexico, if locality healthy. Having had twelve years' experience in wholesale commission and export business in San Francisco is thoroughly conversant with modern business methods, including purchase and transportation of merchandise. Can furnish unqualified references as to character and ability. Address Accountant, this office.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by hydraulic process from Geo. and Lee Pease, in St. George Mine, near Yankee Jim, Placer County, Cal., draining into Devil's Canyon Creek, which reaches North Fork of American River; and from A. Lundberg, in Old Stiff Gravel Mine, near Vallecita, Calaveras County, Cal., draining into Wades Gulch, thence into Coyote Creek, which reaches Stanislaus River, gives notice that a meeting will be held at Room 95 Flood Building, San Francisco, Cal., Dec. 15, 1902, at 1:30 P. M.

MACHINERY FOR SALE.

OFFICE OF GRANITE-BIMETALLIC
CONSOLIDATED MINING CO.

PHILIPSBURG, MONT., October 15, 1902.

Consolidation of plants and change to electric power permit us to offer, subject of course to prior sale, the Engines, Boilers, Machinery, etc., covered by the following list, at greatly reduced prices:

SECOND-HAND MACHINERY ON HAND.

ENGINES.

- 1 Fraser & Chalmers Cross-Compound Condensing Corliss Engine, 22 in. and 38 in. dia. x 60 in. cylinders, 500 H. P., with jet condenser.
- 1 same as above with Knowles Vacuum Pump and Condenser.
- 1 Fraser & Chalmers Corliss Engine, 18 in. x 42 in., 227 H. P. at 100 lbs., cut-off at $\frac{1}{4}$ stroke.
- 1 Hor. Atlas Engine, 8 in. x 12 in., 25 H. P.
- 1 Hor. Atlas Engine, 9 in. x 14 in., 30 H. P.
- 2 McIntosh & Seymour High Speed Engines, 9 in. x 12 in., 30 H. P.
- 1 McIntosh & Seymour High Speed Engine, 7 in. x 12 in., 15 H. P.
- 3 Upright Engines, 8 in. x 8 in., 15 H. P.

AIR COMPRESSORS.

- 1 Ingersoll Straight Line Air Compressor, steam cyl. 24 in., air cyl. 24 in., stroke 30 in.
- 1 Ingersoll Straight Line, steam cyl. 16 in., air cyl. 16 in., stroke 34 in.
- 1 Norwalk Compressor, steam cyl. 14 in. L. P., air cyl. 16 in. H. P., air cyl. 10 in., stroke 16 in.
- 1 Knowles Hor. Compressor Blower, steam cyl. 12 in., air cyl. 20 in., stroke 24 in.

HEATERS.

- 1 Tubular Heater, 80 in. x 9 ft.
- 1 Tubular Heater, 36 in. x 12 ft.
- 1 Tubular Heater, 18 in. x 9 ft.
- 1 Tubular Heater, 36 in. x 7 ft. 6 in.
- 1 Tubular Heater, 36 in. x 10 ft.

AIR RECEIVERS.

- 6 Air Receivers, 60 in. x 20 ft.
- 1 Air Receiver, 48 in. x 15 ft.
- 1 Air Receiver, 36 in. x 13 ft.
- 1 Air Receiver, 36 in. x 9 ft. 6 in.
- 1 Air Receiver, 42 in. x 8 ft.

PUMPS.

- 1 Knowles Compound Condensing Duplex Plunger Pump, special pot-valve pattern. L. P. steam cyl. 24 in., H. P. steam cyl. 14 in., stroke 18 in. Scotch vacuum pump 8 in. x 12 in. x 12 in.
- 1 Knowles Compound Condensing Duplex Plunger Pump, 1 L. P. steam cyl. 18 in., H. P. steam cyl. 10 in., Dia. plungers 7 in. Stroke 18 in. Vacuum pump $6\frac{1}{2}$ in. x 12 in. x 10 in.
- 1 Knowles Double Plunger Pump, special pot-valve pattern, 18 in. x 24 in. steam cyl., 8 in. plungers.
- 1 Knowles Double Plunger Pump, same as above.
- 1 Station Pump, 14 in. x 16 in. cyl., 7 in. plungers
- 4 Boiler Feed Pumps, 8 in. x 10 in. cyl., 5 in. plungers.
- 3 Knowles Sinking Pumps, 14 x 7 x 5 x 10 in.
- 1 Knowles Sinking Pump, 12 x 8 $\frac{1}{2}$ x 6 x 12 in.

PLANERS.

- 1 Iron Planer, 7 ft. x 21 in. bed, planes 34 in. high, 24 in. wide, ways 9 ft. 6 in. long (Lathes & Morse Tool Co., Worcester, Mass.)
- 1 Planer, 20 in. x 5 ft. bed, planes 21 $\frac{1}{2}$ in. wide, 24 in. high, ways 7 ft. 6 in. long.
- 1 L. B. Reed (Cairo, Ill.) Planer, planes 33 in. x 30 in. between uprights, 24 $\frac{1}{2}$ in. x 9 ft. 6 in. long.

LATHES.

- 1 Fifield Engine Lathe, swing 30 $\frac{1}{2}$ in. Dis. centers 16 ft., bed 21 ft. over all.
- 1 L. B. Reed (Cairo, Ill.) Lathe, swing 24 in. Dis. centers 8 ft.

DRILL PRESS.

- 1 Vertical Drilling Machine, table 30 in. dia.

BOLT CUTTERS.

- 1 Bolt Cutter, hand or power, cuts pipe up to 2 in. dia.
- 1 Bolt Cutter, cuts pipe 1 $\frac{1}{2}$ in. and under.

DYNAMOS.

- 1 T. H. Motor, Type "E," 250 light, 110 volt.
- 1 T. H. Motor, 250 light, 110 volt.
- 1 T. H. Motor, Type "E-1," 200 light, 110 volt.

DIAMOND DRILL.

- 1 American Diamond Drill Boring Co., 115 Courtland St., New York. Double cylinders 4 in. x 4 in., tube bore 1 $\frac{1}{2}$ in. Drills 1 $\frac{1}{2}$ in. hole. For steam or air.

For further information, prices, etc., address
WERNER ZIEGLER, Supt. Granite-Bimetallic
Consolidated Mining Co., Philipsburg, Mont.

For Sale, Cheap for Cash.

- 20-Stamp Mill,
- 1 Corliss Engine,
- 1-70 H. P. Boiler (good as new),
- 6 Concentrators,
- 2 Large Pumps, 1 Feed Pump,
- Some Belting, Fixtures, etc.

7 miles from Redding, Cal., 4 from Keswick.
H. C. Woodrow,
WHITEHOUSE P. O., SHASTA CO., CAL.

FOR SALE--A BARGAIN.

- 3 Practically New Five-Foot Huntington Mills with Extras. All in Al Condition.
 - Also, 1 New Four-Foot Frue Vanner.
 - Absolutely New. Perfect Condition.
- Address FRICOT & MILLER,
Latrobe, El Dorado Co., Cal.

FOR SALE.

- 1,000,000 ft. of standard black wrought iron pipe, second hand, in good condition, size $\frac{3}{4}$ to 12 in.
- 500,000 ft. of flanged wrought iron casing, size 2 to 6 in.
- 225,000 ft. of flanged threaded end casing, size 2 to 3 $\frac{1}{2}$ in.
- 10,000 ft. of 6-in. riveted steel pipe.

ENGINES.

- One 30x60 right hand Fraser & Chandler Corliss engine with flywheel 18 ft. dia. x 44 in. face, complete, in first-class order, ready for immediate delivery.
- We also have with this engine a triple leather driving belt 160 ft. (endless.)
- One 16x38 left hand Corliss engine with flywheel 11 ft. dia. x 30 in. face, complete and in first-class order.
- One 24x48 Wheelock Corliss engine
- One 20x32 Webster, Camp & Lane double cylinder double drum hoist.

BOILERS.

- One 250 and one 450 H. P. Hazleton tripod boilers.
- Two 104 H. P. Abendroth & Root boilers.
- Two 185 H. P. Abendroth & Root boilers.
- Four 250 H. P. Campbell & Zell water tube boilers.
- Four 135 H. P. Babcock & Wilcox water tube boilers.
- One 75 H. P. Heine water tube boiler.

AIR COMPRESSOR.

- One 20x24x34 National Drill & Compressor Co. air compressor.

The above items do not represent all of the machinery we have in stock. In addition, we offer you all kinds of automatic, compound and slide valve engines, ranging in size from 3 to 250 H. P. Horizontal tubular boilers ranging from 10 to 150 H. P. Vertical boilers, both submerged and full length tubes, from 5 to 100 H. P. Fire-ho boilers from 15 to 100 H. P. One Silsby fire pump; besides we have single, duplex and compound pumps of every size. 100,000 ft. of fire hose from the Pan-American Exposition. Hoisting rope of all sizes. Shafting, pulleys, belting and a full line of mill supplies. Four turbine water wheels from 25 to 80 H. P.

Ask for Our Complete Catalogue No. 360.

CHICAGO
HOUSE WRECKING CO.

West 35th and Iron Streets,

CHICAGO, ILL.

AT A BARGAIN.

- 2 PELTON WATER WHEELS, 6' diameter with sheet steel discs $\frac{3}{8}$ " thick secured to 3" shafts 4 $\frac{1}{2}$ " long.
- 42 BRASS BUCKETS, 3' across face and riveted to steel disc 5 $\frac{1}{2}$ " apart.
- STAND PIPE FOR TWO NOZZLES, one $\frac{3}{4}$ " diameter, the other 1 $\frac{1}{8}$ " diameter. Lever and hood for closing 1 $\frac{1}{8}$ " Nozzle. Size of Stand Pipe 4" diameter.
- 2 SHEET IRON HOODS for Wheels.
- WHEELS built for 400' head.

Address
CALIFORNIA POWDER WORKS
330 Market Street,
SAN FRANCISCO, CAL.

Second Hand Machinery.

ALL MACHINERY IS REBUILT AND
FULLY GUARANTEED.

Many of the largest mines, mills and smelters are our regular customers. A good stock of all kinds of machinery always on hand. Send us your name and we will keep you posted on bargains in machinery.

S. S. MACHINERY COMPANY,
Office, 1529 Lawrence St. Denver, Colo.
Works, 6th and Market St.

ENGINES, BOILERS,
PUMPS, Etc.

The UNITED RAILROADS offers for sale, in good order, the following machinery:

- 2 sets of Cross Compound Condensing Engines, Scott & O'Neill cut-off, of 750 H. P. each; cylinders 29 in.—44x60 in. stroke, with direct acting air pump and condenser, Union Iron Works, builders. This firm built the U. S. warship "Oregon."
- 2 Circulating Pumps for condensing plant, Thompson & Evans, builders.
- 6 Elephant Type Boilers, 60 in. x 16 ft., 150 H. P. each, set independent, Union Iron Works, builders.
- 2 Boiler Feed Pumps, Thompson & Evans, builders.
- 1 Deep Well Pump, Thompson & Evans, builders.
- 1 Double Reversible Link Engine, about 15 H. P.

ALSO,

- 2 sets of Engines built by the Risdon Iron & Locomotive Works, each set consisting of a triple expansion jet condensing engine 15x24x38 in., of 550 I. H. P., high and intermediate pressure cylinders being tandem, of the Reynolds & Corliss types, and the low pressure being a cross with Myers cut-off, each set having an independent air pump division steam end 12x16 in. with Risdon Iron Works condenser.
- 5 Sterling Boilers, 250 H. P. each, drums 2 ft. 10 in. x 11 ft., and 24 tubes.
- 2 Risdon Condensers.
- 1 Circulating Engine.
- 2 Risdon A'r Pumps 9x15 in.
- 1 Davidson Fire Pump 5x7x10 in.
- 2 Davidson Feed Pumps No. 5.
- 1 Dow Duplex Pump 5x6 in.
- 1 Centrifugal Pump.

The Importance of Formation.

There are those who appear to lay great stress upon the character of the formation inclosing a mineral vein. That this is a matter of grave importance is very doubtful, for it is rather the condition of the inclosing vein walls than their kind, in which the trained mining engineer seeks for an indication of values he cannot positively see. It would be difficult to find a kind of rock in which no mineral veins of value exist, excepting possibly in basalt and the glassy variety of volcanic and intrusive rocks known as obsidian and vitrophyre. Paying mines are found in typical sedimentary beds, as those on the Witwatersrand, and in the quartzites of South Dakota, in Colorado, in southern California and elsewhere. Payable mines are found in all the older crystalline rocks, from the Archæan upward, and in almost every variety of eruptive and volcanic rock known to science, with the possible exception of those first cited. There are mines in granite, in slate, in shale and sandstone, in greenstone, in massive tuffs and breccias.

It has been demonstrated for years that there is no particular importance to be attached to the fact that a mine occurs in this or that formation; but, notwithstanding this, there is a prejudice among many miners for certain kinds of formation and

against others. When one is found having these prejudices, it will usually be learned that he is predisposed in favor of that kind of rock in which he has had the good fortune to "strike it rich," or has seen others do so, while at the same time he has a prejudice against granite because "the veins do not go down," and against limestone because "it is unreliable and bunchy," but he will squander his time on a slate and porphyry or greenstone contact because some great mines are found associated with these formations.

As against this, the miner who has been fortunate in granite or limestone is suspicious perhaps of slate and greenstone or porphyry, while the miner whose

whole experience has been gained in andesite may know nothing of either the granite nor limestone possibilities, and yet each of these formations and many others are equally good ore carriers.

As previously stated, it is the condition of the rock rather than the kind that often affords an index of possibilities to the experienced eye. These conditions are so various that it would be impossible to describe, even in a general way, their numerous characteristics short of a volume, and even then much must remain unsaid. The careful engineer may sample a mine ever so thoroughly and take due cognizance of all exterior facts, having a bearing upon the economics of the proposition under investigation,

and still, to a great extent, he will be guided by intuition—some call it judgment—in drawing his final conclusions and in making recommendations for the future. This intuition or judgment can only come with long and wide experience in many mining fields. If he is a broad-minded and careful observer without prejudice, he will give no attention to the kind of rock inclosing the mineral deposit, but will seek for physical evidences of its condition, the character of the fissure and its walls, the occurrence of intrusive dikes and their apparent relation to the ore deposits and its effect upon them. Volumes have already been written by most competent observers on the "Genesis of Ore Deposits," and many volumes still remain to be written to explain, with the light of wider experience, many of the problems which now perplex the working miner.

ADVERSITY usually develops the latent powers of men and urges them onward to undertake acts previously considered too difficult or impracticable. The downward tendency of silver will seriously affect a large number of mines; but heretofore depreciation of this metal has only stimulated men to new and greater endeavor, and the result has been the discovery and development of new gold mines, and most often these have been found in the heart of the silver-mining districts. It is only natural to assume that this additional decline in silver will be the stimulus which will result in the discovery of other new gold districts and in the development of gold-hearing mines already known.

OBJECTIONS in and out of engineering circles continue to be made against the introduction of the metric system, some of them excellent objections, and well founded. But the metric system will prevail just the same. Conservatism has held back many things and has its uses, but sooner or later the spirit of progress breaks bounds and more direct methods are put in force. The system of standard time was fought for twenty years; in some sections it never has been accepted, but yet generally prevails, and few would go back to the system of time-keeping in vogue in this country prior to 1883. Some time, whether in 1912 or 1952, men will look back at the present cumbersome system of weights and measures and wonder how the spirit of twentieth century and American progress endured such a handicap.

THE manager of the Jumper mine, Stent, Tuolumne county, Cal., has a placard announcing that no one will be employed there who can not talk English. The fact emphasizes the influx of many in the coal and metal mines of this country who do their talking and their thinking in another language than the one generally spoken. The same thing is observable also in England and Scotland. So great is the proportion of alien miners in Scotland of late years that in Lanarkshire nearly 5000 Poles and Lithuanians are now employed with Scottish miners, and in a number of cases the mine rules have been translated into the Russian language and hung alongside the English prints. It is not because of prejudice against foreign labor in the mines of America that reference is made to this matter, but because the presence of men who are unable to speak or understand the English language are in momentary danger themselves, and their presence is a menace to the lives of others. Within the week a Slavonian miner, unable to understand a shout of warning spoken in English, was killed in the Eagle-Shawmut mine, Tuolumne county, Cal. He was unable to make it understood at which level he was to get off the skip. In the event of danger, evident to those foreign-speaking miners, they always call to

each other in their native tongue, and English-speaking men, unable to understand, are sometimes injured in consequence.

Ventilation in Mines.

Of equal importance with safety appliances and precautions in the development, equipment and operation of mines is the necessity for an abundant circulation of pure air in mine workings. Excepting in coal mines, and certain metal mines, where fire damp occurs, though the latter are comparatively rare, too little attention is given to ventilation. Incidentally some mines, through the agency of connections with neighboring property, or by reason of having two or more shafts connected within their own lines, are splendidly ventilated. In such mines only raises, winzes and the bottoms of the main shafts are points where air is temporarily badly ventilated, but even these are far superior to the main workings of other mines not having the advantages of several shafts or outside connections.

In seeking the reason for this neglect to provide proper ventilation it is found that in the early history of the mine a ventilating fan of small size was put in and run until it became absolutely impossible to continue development without more air. A larger blower, sufficiently large for all time, it was supposed, was installed with a special engine and run it, and a new 12-inch pipe line. Down to 1000 feet this ventilating fan and engine may have answered admirably, and made it possible to supply every drift, raise, stope and other excavation with fresh air. But mining operations do not cease, and year by year the workings become deeper and deeper, the long levels are driven out longer, and each succeeding day finds a constantly increasing need of more pure air. While the existing condition is recognized, usually from reasons of economy—false economy—nothing is done to provide better ventilation, and so the situation grows daily worse. Finally, the lower levels, at a distance from the shaft, become simply intolerable. The air is always dense, close, hot, heavily laden with nitrous and carbonic gases, and unfit to breathe. The men stagger from the freshly blasted faces and stopes, rendered weak and sick from lack of oxygen and from breathing poison. Something must be done to improve conditions or work cannot progress. Happy thought. A new ventilating fan is placed on the 1000 or 1200 level, run by water motor driven by mine water caught up several hundred feet above, or if sufficient power is not obtainable in this manner the fan is run by electricity. This new fan is intended to furnish "pure" air to all workings below its station. But does it accomplish the desired result? Scarcely. It will produce a current of air, but the air driven down into the lowest levels is that which is forced out of the long drifts and stopes of the level where the new fan is situated, and from the levels above, and this air is already overlaid with foul gases. These old levels and stopes are full of rotting timbers, which furnish an immense amount of carbonic acid gas, beside that expelled from the lungs of the workmen, and the further exhaustion of the oxygen by breathing and the lights. In certain portions of the mine where the conditions are almost unendurable the superintendent favors the workmen by removing them, and in turn permitting them to work in various parts of the mine where the air is a little better.

Where air compressors are employed to supply machine drills the exhaust of the drills furnishes a given amount of air, but even this is laden with the oil driven into the pipe line from the cylinders of the air compressor, and not particularly agreeable to breathe if one were out of doors, but the miners gladly welcome even this small advantage in their position, if it is an advantage.

Is it economy at all to permit such a condition to obtain, or having been reached, to allow it to continue? It is a recognized fact that this ventilating apparatus was at one time efficient, but the mine usually, sooner or later, outgrows it. Is it not far more economical to provide the power with a fan large enough to thoroughly ventilate the mine, and to drive a sufficient volume of pure, fresh air from the surface to every heading, raise and stope that the men may accomplish more work—and this they certainly can, and will, too, without urging.

The unfortunate miners are afflicted with "miners'

consumption" and it is "hereditary," is the common expression. Nothing of the sort. It is simply that they are starved for lack of the life-giving oxygen, and though they are stout, hardy men, human endurance has its limit with the strongest of them.

It is not only proper to provide a sufficient supply of fresh air to the men below ground, but it is good business, and the increased amount of work accomplished by the miners will quickly pay for the entire expense of the new ventilating plant.

Decaying timbers in mines create a vast amount of carbonic acid gas, and the removal from the mine of all decayed timber that can be recovered will do much to improve the condition of the air, even though it be still fairly good. The practice of throwing decayed timbers in the "fill" of the mine is a very bad one, for while it is only temporarily serviceable as filling, it vitiates the air to an extent far beyond its value as filling, and it really costs little to hoist it to the surface.

JANUARY, 1903, is approaching. Those owning claims upon which they have failed to do assessment work should have this work performed, if in their opinion the claim justifies the expense. One of the best safeguards to good title to a mining claim is to conform absolutely to the requirements of the United States laws in this regard. The law requires \$100 worth of development work or improvements on the claim. A necessary building, a road or a ditch which shall be of actual benefit to the property is permissible as assessment work. When the work is completed the claim owner should file notice with the county recorder setting forth the fact of such work having been performed, and a notice to the same effect posted on the claim. Claims located in the year 1902 require no assessment work during this year unless local law requires it, and this important matter may be put off until such time next year as will permit its performance before January 1, 1904, but such long-deferred work neither tends to develop the mining industry nor to insure the safety of the locator's holding. Some claim holders at this season, who have to travel long distances in order to perform the assessment work, do the work for two years at this time—that is, do the first \$100 worth in December and the second \$100 worth in January, 1903. This will hold the claim nearly two years, when the same method may be repeated. By this means a trip need only be made biennially. Claims located prior to January 1, 1902, upon which the holders have failed to perform the necessary work by midnight, December 31, 1902, are subject to relocation by others, but the former locator cannot hold said claim as against an adverse claimant unless he has actually begun the work and continues until it is completed.

THE natural leaning of most folks toward the hargain counter is worked by the Eastern promoter or dispenser of some mining stocks, the par value of the stock being put high and the price low. The investor when approached in his native lair in the corn fields of Iowa, or the natural gas belt of Ohio, asks: "What is the par value of this mining stock?" If he is told "\$10 a share," but is also told that he can get it for \$2 a share, he immediately figures that he will make \$8 a share on every share he buys, and regrets he can only buy 100 shares when there is such easy chance offered to make money. This is the kind of an investor who buys because he believes what he is told, and afterwards writes to a mining journal for its opinion as to the value of the stock. Then when he finally finds that the Eastern promoter has fooled him he blames Western mines and miners. There are, however, mining stocks that are to-day selling for 50 cents and \$1 per share that, with proper development of the properties, are susceptible of enormous increase in values. Of course just which of the "cheap" stock to buy and which to let alone is the all-important question, and, equally of course, is one to which no definite or satisfactory reply can be given. Cripple Creek, Colo., is adopting a plan which is good as far as it goes, viz.: A systematic effort to have Eastern investors withhold any purchase of mining stocks until they have first secured trustworthy information from there as to the merit of the proffered holdings. Such a general campaign of information would be of commensurate benefit.

Concentrates.

A NICKEL-STEEL alloy with 36% nickel has the lowest temperature coefficient known.

METALLIC piston rod packing is considered a necessity where superheated steam is used.

THERE is no California State law for the examination of stationary engineers; there is for marine engineers.

It is often cheaper to abandon a flitcher hole than to waste half an hour or more in a futile effort to cut it deeper.

THE quantity of zinc annually used in the cyanide process is estimated to constitute about 1% of the total annual zinc production.

TO SOLDER a piece of carbon and a piece of brass together, copper the carbon with a battery and attach the brass with soft solder.

WHERE a cross-bit in a machine drill refuses to turn and the drill may be withdrawn a chisel-bit will frequently operate successfully in finishing the hole.

A CHEAP and easy way to generate oxygen is to heat a mixture of manganese dioxide and potassium chlorate in a metallic flask. The gas should not be disengaged too rapidly, as it might thus occasion an explosion.

ROUND steel bars for car and skip axles are preferable to square bars with the ends turned to fit the wheels, as when worn the round bars may be cut in two with a hack saw and the worn ends welded to form a new ax.

TO DETERMINE the approximate horse power necessary to pump water to a given height by steam, multiply the total weight of water in pounds by height in feet and divide by 16,500. This allows for friction and steam loss.

IF A locates a placer claim, and no reference or stated knowledge of a lode claim therein, and B subsequently locates a known lode claim within the limits of A's placer claim, B can hold his lode location if A has not received a patent.

IT is asserted that an excellent fuel economizer and smoke preventive is made by inserting a pipe in the top of a stack, leaving an annular space of 3 inches between itself and the inside of the stack, extending 8 feet down into the stack and projecting 7 feet above it.

THE cyanide plant of the California King G. M. Co., at Placcho, Cal., is probably as large as any other in the country, having a daily capacity of 1800 tons. The Horseshoe M. Co., at Pluma, S. D., has a cyanide plant capable of treating 1250 tons every twenty-four hours.

THE best way to separate gold and molybdenite when occurring in a quartzose or other earthy gangue is by concentration, as it is almost impossible to amalgamate gold from its ores in the presence of molybdenum or its compounds. The price of molybdenum is quoted in this paper.

SOME smelters charge a stated sum per unit for zinc which occurs in ores when the quantity of zinc exceeds a stated percentage, for the reason that zinc is found to be detrimental to blast furnace operations, and requires certain corrective measures. Smelters which treat high-grade zinc ores employ a different type of furnace from that used in lead smelting.

COMPRESSED AIR can be used in steam engines without any change being made in the construction of the engine if the exhaust be large. A small exhaust will have a tendency to cause the moisture in the air to freeze as it escapes from the vent, but this may be remedied to some extent by causing the air to exhaust underneath water. A better, but more expensive method, is to reheat the air.

A CORNISH PUMP, 25 inches diameter, with 8-foot stroke, will lift 200 miners' inches of water 80 feet at ten strokes per minute. The column pipe should be 18 inches diameter. If the pump is double-acting, the diameter of pump should be 18 inches and diameter of column 13 inches. This requires 75 H. P. A centrifugal pump will accomplish the same result better with continuous flow and same power. The cost of installation of latter is also much less, the column being 12 inches.

A RUNNING wire rope needs a lubricant that will penetrate between all the wires, and must be free from acids. A good lubricant is made of tar, summer oil and mica axle grease in varying proportions to suit varying conditions. At the Lincoln mine, Amador county, Cal., crude petroleum has been successfully introduced as a "rope dope." The oil gives entire satisfaction under the existing conditions, viz., an inclined shaft 2000 feet deep and very wet in the lower portion.

NITRO-GLYCERINE AND NITRO-CELLULOSE are the principal ingredients in the great bulk of high explosives now manufactured. Sixty-two of the eighty-one different explosives consist mainly of either of these two, or of a combination of the two. Insoluble nitro-cellulose is known as guncotton, and soluble nitro-cellulose is known as collodion cotton. Ammonium nitrate is also largely employed in the manufacture of smokeless powder, which leaves no residue upon combustion.

THE best machine drill work in mines is accomplished where the drill runners and chuck tenders realize that a machine drill is an engine and not a piece of solid cast-iron which must be broken up with a hammer. In the majority of cases failure in a drill to do satisfactory work is more the fault of the men running it than of the machine itself. Failure to oil the various parts is a fre-

quent cause of trouble, and a slight slipping of the clamp on the bar will often result in the loss of a hole.

IF A, having applied for patent, fails to make the payment required by law—\$5 per acre—at the proper time, within sixty days of publication of notice of application for patent, patent will not be issued by the United States; but A does not forfeit his possessory title nor his rights obtained under the law governing location of mineral lands. Work performed by B in the meantime may stand as assessment work for A. If A wishes to give clear title to B, he must pay cost of obtaining patent.

WHERE the distance between the hoisting reel and the sheave in the head frame is so great that the rope requires an intermediate support, a grooved sheave 12 to 14 inches diameter running loose on a steel ax or travelling with the ax and situated in a frame built about midway between reel and head frame, will be found to give satisfaction. Solid cylinders in most cases offer so small a surface to the running rope that the latter cuts into the cylinder and also rapidly wears the rope.

HIGH GRADE primers, XXXX to XXXXXX, will generally be found to give better satisfaction than those of lighter grade. One reason for this lies in the fact that the high-grade caps, being more powerful, cause a more complete explosion of the nitro powder, consequently making a more effective blast. High-grade caps are particularly more desirable in wet holes. They are no more dangerous than the XXX caps, being made from the same material, though containing a larger quantity of the explosive—mercury fulminate.

WHEN a crosscut tunnel is projected to explore and develop a vein at considerable depth below the known portions of the vein, it may or may not encounter the vein in the pay zone. Frequently it does not; but if there are pay shoots on the vein, the miner need not be discouraged in finding his crosscut has not struck pay, as a drift to either side along the vein is more than likely to be encountered. When a long and expensive crosscut has been run, it would be unwise to discontinue the work until it had been demonstrated that all veins within the mineralized zone had been cut.

AN alloy said to be equal to cast iron in tensile strength is, according to an authority, made from two parts aluminum and one part zinc. It melts at about 797° F., does not readily oxidize, and resists corrosion well. There is no difficulty in preparing alloy castings having a tensile strength of 4000 pounds per square inch. The alloy, whose specific gravity is 3.3, resembles in its properties high-carbon steel. Alloys containing one to nine parts of zinc to one part of aluminum with specific gravities ranging from 4 to 6 do not appear to possess any particularly valuable mechanical properties.

IN a boiler that carries 100 pounds pressure and develops 100 H. P., as thirty pounds of water constitute a H. P. in this connection, 3000 pounds will be used per hour, or fifty per minute. Ignoring friction in the pipes and calculating that the pump works against 100 pounds pressure, dividing the pressure by .434 shows that it is equivalent to raising it 230 feet high. An automatic non-condensing engine in good order will require about thirty pounds of water per H. P. per hour. A direct acting steam pump may be assumed to require five times as much as the engine, making 150 pounds per hour or 2.5 per minute.

ANY United States assay office—whether at Boise, Idaho, Seattle, Wash., or elsewhere—will advance 90% on all gold received and after the determination of actual value will give a check on the San Francisco sub-treasury. That settlement is on the basis of fine gold. American, French and German gold is deemed nine-tenths fine, British gold eleven-twelfths. American gold coin is received at its face value till the wear or abrasion reaches one-half of 1%, when it is received by weight only. The San Francisco Mint can buy mutilated and uncurrent silver coins in sums in excess of \$3 at a price regularly fixed by the director of the United States Mint for silver contained in gold deposits.

TO DETERMINE what H. P. a shaft of a given diameter will transmit at a given number of revolutions per minute: Cube the diameter of the shaft; multiply the quantity by the number of revolutions per minute; divide this product by the constant number 75; the quotient will be the H. P. To determine the diameter of a shaft to transmit a given H. P. at a given number of revolutions per minute: Multiply the given H. P. by the constant number 75; divide the product by the cube of the diameter of the shaft. The quotient will give the required speed. If the diameter of shaft should be an odd size, take the nearest commercial size.

THE United States Statutes provide for the formation of townships as follows: "Whenever any portion of the public lands have been or may be settled upon and occupied as a townsite, not subject to entry under the agricultural pre-emption laws, it is lawful, in case such town be incorporated for the corporate authorities thereof, and if not incorporated, for the judge of the county court in which such town is situated, to enter at the proper land office, and at the minimum price, the land so settled and occupied, in trust for the several use and benefit of the occupants thereof, according to their re-

spective interests; the execution of which trust, as to the disposal of the lots in such town, and the proceeds of the sales thereof, to be conducted under such regulations as may be prescribed by the legislative authority of the State or Territory in which the same may be situated." The townsite patent, however, does not convey any right whatever to the mineral contained under the surface.

REGARDING the lubrication of an air compressor it is to be borne in mind that air cylinders do not require oil either in quality or quantity like steam cylinders. What is good for the one is bad for the other. A steam cylinder needs an oil of low flashing point, and plenty of it, because the tendency of the wet steam is to wash the oil out of the cylinder. With air there is no washing tendency and a little oil will last for a long time. This oil should be of the best quality and of a high flashing point. It should not be a coking oil, that is when evaporated on a piece of hot metal it should not leave a carbon deposit. The actual amount of oil that should be used in an air cylinder is one-quarter that which should be used in a steam cylinder of the same size. Too much oil tends to choke the valves and ports. A discharge valve might stick through coking, and when stuck it will admit some of the hot compressed air into the cylinder against the receding piston, which on the return stroke is compressed and carried to a temperature beyond the flashing point. Sometimes when discharge valves give trouble they are cleaned by injecting kerosene, which is poor practice. Kerosene should never be used in the air cylinder; instead fill the oil cup with soapsuds made preferably of soft soap, and feed this into the cylinder; let the compressor work with soapsuds instead of oil for a day each week and no harm is done, care being taken to feed with oil a half hour before stopping, so that the parts may not be subject to rust, which is the only danger from soapsuds.

THE cost of a slimes plant to treat tailings from a 40-stamp mill will range from \$4000 to \$7000, depending on variable cost of suitable lumber, and whether plant is under cover or open. A long, narrow plant is less expensive than a square one. The sides of the building may be kept open during the spring and summer and inclosed in the fall by using the old canvas taken from the tables. It will be found that the canvas arrests the sulphides better when it has been in use for some time than when new, as new canvas has a tendency to hold sand as well as sulphides. Some operators paint their canvas when new. The lumber should be clear, and in any event knotholes must be avoided. It should be dressed on one side. The dry boards when first placed should be spaced $\frac{1}{2}$ to $\frac{3}{4}$ inch. The lumber will swell when wet and make a smooth surface. If the boards be placed close, upon becoming water-soaked, they will buckle. In some cases the boards are first soaked in water and then laid tight; but generally the spading method gives more satisfactory results. Particular attention must be given the construction of foundations, as the entire plant, to accomplish the best results, must form a perfectly even inclined plane. The question of grade must be determined by experiment, and, in view of this, the best plants are provided with a mechanical device for changing the grade of tables at will. This is effected by the employment of either cams or wedges. The grade is usually about $1\frac{1}{2}$ inch to $1\frac{1}{2}$ inch in 12 inches. Abundance of clear water is essential to the best results, as clean concentrates can not be obtained without "purifying," by which is meant the shutting off of the pulp and allowing clear water to run over the table to remove superfluous sand before sweeping or sluicing off the sulphides with hose and flat nozzle. In slimes plants the best results are obtained by the use of a hydraulic sizer (a form of the German splitzkasten) at the head of the plant, as the volume of tailings from the mill is too large to be successfully handled on the tables. A 40-stamp mill will discharge generally from 200 to 300 cubic feet of water per minute carrying 150 to 225 pounds of sand and sulphides. In some plants, where the sulphides or other high-grade value carriers are in a very fine state of division, the material is passed through a second sizer and the slimes run over a second series of tables set on a lighter grade. Material of this class requires very careful manipulation, as much of the highest grade material is held in suspension in the water. This may be collected in settling tanks arranged in series, and the suspended material thrown down by the introduction of quicklime, the stream being diverted to another series of tanks, while the slimes thus accumulated are removed from the first series. To best accomplish this the water should be decanted by means of holes in the side of the tank, arranged at varying elevation, and provided with wooden plugs. By this method a large percentage of the finest slimes are recovered. While the art of concentrating sulphides from tailings is not a difficult one to learn, a novice would make sad work at first without competent and painstaking instruction. There are men who have made and are still making this class of concentration their life study, and the frequent changes of method, though these are not radical, indicate that experimentation is going on and further improvements made in method. As a matter of course, a plant adapted to a smaller mill will cost proportionately less than the cost above given, which is for a 40-stamp mill crushing 3000 to 4500 tons per month. Where the topography of the ground will permit, the plant should be so arranged as to perform all operations by gravity, as a resort to mechanical means—conveyors or elevators—for raising pulp from one part of the plant to another involves a constant expense.

Mine Timbering by the Square Set System at Rossland, B. C.

The article by Mr. Bernard MacDonald which appeared with numerous illustrations in the issue of the MINING AND SCIENTIFIC PRESS of September 20th has attracted wide attention and comment in the mining world. At a recent meeting of the Canadian Institute, Mr. Ernest Woakes of Nelson, B. C., read the following interesting paper in discussion of the article by Mr. MacDonald:

I have read with much interest Mr. Bernard MacDonald's paper on the square set system of timbering used at the Le Roi mine and I should like to hear from that gentleman how he would have adapted his system to the peculiar conditions which existed at the Darien gold mines in the Republic of Colombia, South America, a mine of which the writer had charge some years ago.

In Vol. XXIX of the Transactions of the American Institute of Mining Engineers the above mine is fully described. The ore body may be roughly described as having the form of an irregular quadrilateral measuring 90 feet wide from north to south and 120 feet long from east to west, and standing nearly perpendicular. The country rock was a decomposed andesite having many cleavage planes, so that it was very liable to break up and cave if left unsupported. The ore body was composed of boulders and rock fragments from the adjoining country rock varying in size from pieces as small as a walnut to masses of many tons weight. These fragments are generally completely angular, partaking of a breccia-like formation, but at times they were rounded and resembled a conglomerate. The rock fragments are completely surrounded and cemented together by concentric shells of crystalline sulphurets and calcite with a little quartz. The gold was mostly free and was found almost entirely in the cementing materials. The ore was very high grade.

Timber was fairly plentiful, but, as in most tropical countries, the majority of it was of very poor quality. It commences to decompose almost as soon as cut, and for all underground purposes cannot be relied upon for much over twelve months. The square set system was introduced and practical men from Nevada were engaged to teach the natives how to prepare and set up the sets. Round timbers were used for the posts and nothing under 18 inches diameter was put in. The caps were flattened by adzing on two sides and the ties were of sawn lumber 8x10 inches. Great care was taken in setting the sills in each level—they were set north and south, east and west, with the idea of making sure that the uppermost tiers in one stope would eventually correspond as nearly as possible with the sill sets of the stope above. It was also found useful at times in the mine to know the exact bearing by means of the timbers. Very soon after starting stoping it was found to be necessary to keep the sets close up to the stoping faces or falls would occur. The conditions were much aggravated in the upper levels by the presence of old workings. Finally, after the whole width of the ore body had been stoped and the sets carried up from four to six sets high, it was found that the ore body was commencing to settle and the whole weight was on the timbers. Falls and caves became more frequent and finally a cave started above the upper floor and kept breaking away upwards to such an extent that it could not be caught up and eventually the whole stope crushed in, the timbers being forced out of plumb as the weight on them increased. False sets and diagonal braces were put in to resist the pressure, but this was of only temporary assistance. After the cave a tunnel was driven in the country rock round three sides of the ore deposit and crosscuts driven in from it and the ore extracted as it ran down, temporary sets being put in where necessary. In this way the ore was taken out until surface rock and tree stumps began to show in the stopes. In the deeper levels it was decided to try a different system. The square sets were put in as before, but were only carried three or four sets wide all round the ore deposit, leaving a large square pillar in the center which was taken out as far as was possible after the greater part of the ore body had been removed. Crosscuts were driven into the country rock from the various floors and the waste rock from these dumped into the stopes where the timber showed the worst signs of squeezing. It was not deemed prudent to leave any ore in the stope as filling, it being of such high grade that the loss would be very great. Besides, as is unfortunately so often the case, the mill was generally calling on the mine for ore. It was a very wet mine and the rainfall was excessive—110 inches a year. For this reason it was not desirable to have large open workings at the surface liable to sudden flooding, as would have been the case if filling from the surface had been resorted to, as is the case with the Ymir mine in this country. Of course, I believe that in most cases where wide deposits have to be worked the square set system of timbering is the most satisfactory, if the mine can stand the cost of it; and after the mines have attained a certain depth, it will often be found to be the only one possible. Luckily for mine managers, conditions such as above described are not likely to

exist very often; and if they do exist in the upper levels, it is to be expected that the ground will get harder and less liable to cave as depth is attained.

In reply to Mr. Woakes, Mr. MacDonald offered the following suggestions:

I have read with great interest Mr. Woakes' criticism on my paper, "Mine Timbering by the Square Set System," and also that gentleman's excellent article in Vol. XXIX of the Transactions of the American Institute of Mining Engineers, describing the Darien mine. I am sure any one who gives himself the pleasure of reading Mr. Woakes' description of this mining property will find corroborative evidence of the proposition that "no two mines are exactly alike."

In replying to Mr. Woakes' criticism, I do so with the full knowledge of the difficulty of prescribing for a patient, without first seeing him and studying the idiosyncrasies of the malady. Therefore, the method of stoping and timbering the ore bodies in the Darien mine, which I would propose as best suited for the peculiar conditions existing there, would be considered as given under existing circumstances.

As a general rule, when an underground ore body is being mined, greater strains are exerted on the timbers by the pressure on the enclosing walls than from the overhanging ore. On this account, the method of extracting the ore body generally adopted is by stopes or steps running horizontally within the vein and along it over the various levels, and the spaces thus exhausted are timbered by "floors" or square sets extending horizontally between the enclosing walls. This is the method described in my paper.

But it seems that the generally prevailing conditions in mining operations were quite reversed at the Darien mine, where the greater strains came from the overhanging ore, instead of, as is usual, from the enclosing walls. This might, in a measure, have been suspected from Mr. Woakes' description of the physical characteristics of the ore and the nearly vertical dips of the enclosing walls.

I would meet these reversed conditions by reversing the usual methods, or, I should say, direction of the stoping and timbering, viz.: I would run the stopes or steps of the excavation vertically upward between the mine levels, instead of horizontally over them.

For example: In stoping out any block of ore developed between two levels, I would first run a raise vertically through it, making such raise wide enough to be timbered into two compartments by two square sets going up in it side by side. When completed, this raise would furnish means of ventilation and access for men and material to whatever part of the ore body the work of stoping might be going on. I would then run all the stopes vertically upwards around this raise, commencing at the lower level and finishing at the upper level, mining out just enough ore at a time to admit of one new set of timbers being placed in the excavation. By this method all the ore, except the one stope being excavated, would be supported on a solid foundation of ore in place. In case lateral or vertical pressure would give the timber sets a tendency to swing or "jack knife" out of their true horizontal and vertical positions, as would probably be the case, I would keep the skeleton framework of the sets filled up with broken ore until all the block between levels was broken down. This method of temporary filling locks up for the time being about two-thirds of the ore in the stopes. The swell in volume of the broken ore over that in place is only about one-third. However, the two-thirds used for temporary filling could be drawn off after the work of stoping was completed, so that, except for the time being, no more ore used in filling would be lost.

Mr. MacDonald's idea is a thoroughly practical one, and would undoubtedly meet the peculiar requirements of the Darien mine, as well as any other. In addition to the advice of Mr. MacDonald, it is suggested that the method of framing timbers might also be changed to meet the heavy down weight. In timbering by the square set method there are three systems or combinations of systems. These are a system to resist a pressure mostly exerted from the side; a system to resist downward weight; and a system to resist a diagonal thrust, the latter being a combination of the other two. In the first system the timbers are so framed that the caps are butted together, forming a practically continuous cap from wall, the ties keeping the sets from riding. In the second system the posts are butted end to end, forming a continuous post, resisting the heavy down weight, and in the third either of these systems is supplemented by diagonal braces, placed within the sets, and heading upward toward the hanging wall. Large stopes in any sort of ground can be excavated in blocks of relatively small superficial area, as suggested by Mr. MacDonald, with greater safety than where large areas are removed at one time. Immediate and close filling in most cases are indispensable in connection with the square set method of

timbering. Ever since the square set was introduced in the Comstock lode by P. Deidesheimer in 1860 all attempts to support mountains on timber have proven abortive, and numerous caves in great mines everywhere that this "economical" method has been tried attest that contemporaneous filling is absolutely necessary to safety and complete removal of ore.

The means of obtaining filling is always important, because this must be accomplished at the least possible expense, and in some mines the grade of ore is so low as to make the employment of filling prohibitive. In such cases the only apparent remedy is to stope as far as it can be safely done, timbering by the square set method, and at the first sign of collapse to abandon the stope and avoid disaster. This is unsatisfactory to the mine owner; but, if any better way can be suggested, we would be pleased to learn something of it.—Ed.

Notes on Assaying.*

In very many assay laboratories it is customary to use for fluxing purposes borax of various and uncertain degrees of hydration. I have even seen used in several places the fully hydrated $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, which contains 47% of water.

Such procedure appears obviously incorrect, since every single gram of such fully hydrated borax will give rise to .5 gram (half a gram) of water, which, at a temperature, say, of 200° C., will measure about 1000 cubic centimeters.

This will necessitate a considerable amount of dusting and unnecessary loss in the assay. Similar remarks apply to the use of more or less fully hydrated sodium carbonate and sodium bicarbonate. Looking at the subject from quite another point of view, one has to question the wisdom of handling by steamer and railway an excessive weight of material of which a large and useless percentage is water and carbonic acid, one or both.

In the formation of alkaline silicates by the action of Na_2CO_3 on SiO_2 , there is necessarily eliminated a certain quantity of CO_2 , but this takes place when the slag is already pasty or fused; hence, mechanical losses are probably totally absent.

On the other hand, when using either $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, Na_2HCO_3 or $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$, there must first be formed in the crucible, respectively, $\text{Na}_2\text{B}_4\text{O}_7$, anhydrous, and Na_2CO_3 , anhydrous in the two latter cases before any fluxing action or fusion can take place.

Hence, as will be readily seen, very large volumes of gases will be given off while the whole charge is still in a pulverulent condition.

It is difficult to understand how such authorities, presumably practical, as Ricketts, Beringer and many others persistently recommend the use of NaHCO_3 (sodium bicarbonate), which contains superfluous water and carbonic acid, and these same authorities primarily recommend the use of hydrated borax, but mention anhydrous borax (borax glass) as an alternative. Of course, it is quite possible that with care the dusting losses from the use of hydrated fluxes might be—at least, in the case of low-grade ores, etc.—practically negligible; but is there any corresponding benefit to be obtained by running these risks, even if they are of the very slightest?

In laying out the reduction works for a mine, one has to consider the best positions for the various departments; and here comes in a point on which there is often a difference of opinion. I refer to the position of the assay laboratory with regard to the refinery or smelting room.

It seems to me that the assay laboratory and refinery should be quite distinct from each other, and if the assayer also does the smelting, all possible precautions as regards clothes and washing should be exercised, and all tools, fluxes, etc., employed in the refinery should be quite distinct from the assay laboratory equipment. On the other hand, it is the custom in many places, which I prefer not to name, though I can say they are not in South Africa, to have one common furnace room for both refining and assaying, and even in one or two cases to use the same furnaces for both classes of work; the results obtained occasionally can be guessed, especially when assaying low-grade material. The opinions of members of this society on this point would, doubtless, be extremely instructive and interesting.

The writer has found the following to be a perfectly accurate and very rapid method of assaying gold-bearing solutions when large volumes of solution have to be operated on:

The solution for assay is placed in a boiling flask of convenient size rendered strongly acid by sulphuric acid raised to the boiling point; about thirty grams of zinc shavings are then added in quantities of about five grams at a time, seeing that all action ceases from each addition of zinc before the next addition of zinc is made. The solution must be kept strongly acid throughout, adding more acid if necessary, and

*H. T. Durant, in Journal Chemical and Metallurgical Society of

must also be kept at boiling point throughout the whole operation.

After all the zinc has dissolved there will be a slight residue of lead, carbon, etc.; then remove from source of heat and add about one gram of precipitated silica to "collect." Then filter through a double filter paper and wash out flask well onto the filter paper; then fold up the moist filter paper and place on a layer of borax in a scorifier to dry and char slowly in front of the muffle; when this is complete add granulated lead or litharge and reducing agent and scorify as usual, cleaning the slag, if necessary. The method depends on the action of nascent hydrogen, and is by no means novel—at least in theory.

It would be unreliable in the case of assaying solutions for silver, since some of the latter metal would pass into solution as sulphate.

Belcher and Red Rock Mines.

In the narrow canyon of the Big Bug, Yavapai county, Ariz., is the mining camp of Providence,

property to reach your vein, the consent of the owner must be obtained. This could probably be best arranged in the form of a lease for a term of years, for which you annually pay a stated sum. If all the conditions are set forth in the lease and the same placed on record, it would be safe.

Cyaniding Silver Ores.

Written for the MINING AND SCIENTIFIC PRESS by
R. STUART BROWNE.

Since the discovery of the rich ore deposits in and around Tonopah, Nevada, a great impetus has been given to mining throughout the State. Many of the old mines that were shut down years ago are being opened up, and it is hoped that with the present advanced state of metallurgical knowledge and the lower cost of supplies to put them on a paying basis again.

A great deal of experimental work is being done in an effort to apply the cyanide process to the treat-

minerals and the usual porous condition of the matrix. I have seen accounts wherein it was stated that cyanide plants operating on these ores had been able to recover in the neighborhood of but 80% of the silver values. This low result I attribute either to excessively coarse crushing or else that the silver was not all in the form of chloride as stated. From my own experience I am satisfied that not under 95% of the silver present as chloride can ordinarily be recovered by the cyanide process.

In the sulphide ores, argentite or silver glance is the most important mineral. Ores containing it will not give a big extraction with cyanide; nor is it a very desirable substance to treat as it introduces K_2S into the working solutions. Argentite is slowly soluble in strong cyanide solutions according to the following reaction:

The rate of solution is increased by fine crushing and strong solution, while time is the percentage factor. For reasons of economy there is a limit beyond which it is not advisable to increase the strength of solution. Better results will be obtained by using a large volume of solution than a smaller quantity, though the total amount of cyanide contained in both is equal. Sulphide ores from different mines frequently show a wide divergence in their chemical behavior. It is not safe to accept the results of another operator except in generalities. Only a careful examination of the ore in question will demonstrate its fitness for treatment. In treating almost identical ores from different districts I have had extremely variable results. I think this was due in part to slight variations in the chemical composition of the mineral. Argentite when pure has the formula Ag_2S but usually shows the presence of impurities. On certain New Zealand ores as high as 85% of the silver present as sulphide has been recovered. In this case the mineral was in an extremely fine state of division which favored high extraction. With the usual run of ores the extraction will be about 55%. I have shown how potassium sulphide is introduced into the working solutions. It is a very dangerous reagent to have present, as there is always a possibility of its reprecipitating the precious metals in the ore. This undoubtedly happens when the solutions become weak in cyanide. To overcome this tendency strong solutions must be used which will redissolve the metals should they be thrown down. Potassium sulphide also retards the rate of solution. During the past year I have been treating ore containing several ounces of silver sulphide. I invariably get a higher extraction when starting in on fresh solution; the extraction gradually decreasing up to the time when I run my solution to waste. As a general rule ores containing silver sulphide are not adapted to cyanide treatment without a preliminary chloridizing roast. Where the ore contains gold values and the recovery of the silver is of secondary consideration it may be advisable to omit the roasting and leach the raw ore, recovering such silver values as are possible. In the third class of silver ores are included the sulph-arsenides and sulph-antimonides. The principal minerals are pyrrargyrite or dark ruby silver ore, Ag_3S_2Sb , proustite or light ruby silver ore, Ag_3S_2As , and stephenite or brittle silver ore, Ag_5S_4Sb . These are the most refractory silver ores we have to deal with. In the raw state cyanide exerts very little solvent power on them. A year and a half ago I began a series of experiments on these ores and the results were very unsatisfactory as regards extraction. In the very favorable conditions of laboratory work the extraction never exceeded 30% and was frequently as low as 7%, while the consumption of cyanide was abnormally high. By giving the ore a chloridizing roast no trouble was experienced in cyaniding them. When it becomes necessary to roast an ore the greatest skill must be exercised in converting as much of the silver as is possible into a chloride, for the extraction will be just about equal to the per cent chloridized. This will ordinarily vary from 80% to 90%. During the roasting a large quantity of soluble salts are formed, principally chlorides, sulphates, arsenates and antimonates. If allowed to remain in the ore these salts would soon foul the solutions and also injure the precipitation. The only means of getting rid of these objectionable compounds seems to be by a prolonged water wash. This wash water will carry considerable of the values, and to recover them it must be conducted to tanks and the metals precipitated. Zinc precipitation is not practicable in this case and as the wash water usually comes off acid the use of a sulphide as a precipitant naturally suggests itself. Up to this point the operations are identical with those of the old byposulphite lixiviation process. The question naturally arises, why not continue on and use hypo instead of cyanide. This would open up too long a discussion. It is sufficient that the cyanide process has proven itself very much superior to the older method of treatment. Where the ore carries appreciable gold values the use of hypo should not be even considered. There is a class of ore in which I believe the byposulphite process will find its particular field. This is where a silver ore carries copper. The Park-Whitaker process subjects this class of ore to a chloridizing roast, then leaches out the copper chloride with water and applies cyanide. I very

Belcher and Red Rock Mines, Providence, Ariz.

wherein are the Belcher and Red Rock mines—the latter one of the three properties of the United Verde Extension Co. The Red Rock ore is a sulphide, sent to the Val Verde smelter.

Forfeiture and Failure to Contribute to Assessment Work.

TO THE EDITOR:—Please tell us what can be done with a co-owner in a mining claim when he won't help do the assessment work nor pay his part. You have probably answered this many times, but please answer it once more for a constant reader. Also answer this question: By running a short tunnel we could cut our ledge easily, but it is next to impossible to sink a shaft on the side of a steep mountain. Can we go on another man's claim and run our tunnel? They would certainly give their consent, but would it always be safe?

Amalie, Kern Co., Cal., Dec. 7.

In answer to the first question, Section 2324, Revised Statutes of the United States, provides for annual labor or improvements on an unpatented mining claim to the value of \$100, and additionally says: "Upon the failure of any one of several co-owners to contribute his proportion of the expenditures required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week, for ninety days, and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent should fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made required expenditures." It is to be noted that 180 days must elapse after the first appearance of the notice of publication.

In order to drive a tunnel through an adjoining

ment of the silver ores which are found so abundantly in the State. In many cases a gratifying success has attended these efforts, but in some instances, owing to the complex nature of the ore, only a partial extraction was obtainable. Some ores are susceptible to cyanide treatment in the raw state, while others require a preliminary chloridizing roast before they become amenable. Silver ores may be divided into three general classes: the chloride, sulphide, and the sulph-arsenide with the sulph-antimonide. The so-called chloride ores include all those in which the silver is combined with chlorine, bromine or iodine. Cerargyrite, $AgCl$, and bromyrite, $AgBr$, are the most important minerals of this division. In some mines they constitute the principal values. These are the most favorable ores for cyaniding. Practically all of the silver will pass into solution, the percentage of extraction depending only on the ability to displace all of the solution by wash water. The silver dissolves with great rapidity according to the following reaction:

These reactions are of a different type than that which takes place in cyaniding gold ores in as much as oxygen does not form a part of it. The great advantage of treating such ores is at once apparent. It also explains in part the rapidity with which the silver is extracted. I might say here that generally when cyanide acts on a metal in combination with another element, oxygen is not necessary to complete the reaction. It is necessary to have either a radical or an acid element to combine with the potassium liberated from the cyanide. If the compound acted upon by the cyanide is capable of furnishing such, then any oxygen present will remain inert. For lixiviation, chloride ores usually admit of very coarse crushing, because of the earthy nature of the

much doubt the advantage of cyanide in this case. Though cyanide will give a high extraction with chlorides it is not economical to treat high-grade ores. The consumption of chemicals may become so great as to make treatment by another process advantageous. Consider the case of an ore carrying 200 ounces silver in the form of chloride. The theoretical consumption of cyanide would be sixteen and one-half pounds per ton of ore treated. From practical experience we know that a very much larger amount would be used up. Such an ore could be treated with greater economy by some other process. Pan amalgamation followed by cyanide would probably be the most satisfactory treatment. It is with low-grade ores, and particularly those carrying gold values that the cyanide process will find its most useful field. To treat these ores successfully requires a high degree of technical skill. The various problems presented by the losses in roasting and water washes, chlorination, elimination of soluble salts and difficulties of precipitation present an inviting field to the metallurgical student.

Austin, Nev., Dec. 1.

A Dry Process for the Treatment of Complex Sulphide Ores.*

By H. L. SULMAN and H. K. PICARD.

The class of ores to which our process is applicable is that in which zinc blende and galena predominate, substantial silver values being also generally present; these, commonly known as "complex sulphide ores," are typified by the Broken Hill deposits. The latter indeed are usually of refractory character, the metallurgical difficulties attending the separation of the lead and zinc being increased by the intimate intercrystallization of the minerals, as well as by the presence of ferrous sulphides, garnet, rhodonite, etc., in considerable quantity.

It is unnecessary to review at length the many attempts to treat these ores, the more important later efforts being well known to members of this Institution; and much valuable information as to the types and values of the Broken Hill deposits is to be found in Mr. Ashcroft's paper.

Before entering into the details of our process, it is advisable to briefly indicate the methods at present employed in recovering the major values from such ores. They are all comprised under the head of concentration, the usual various types of apparatus, both wet and magnetic, being employed. Concentration, indeed, has here been carried to a state of high perfection; but, however ingeniously applied, it can not, owing to intercrystallization and the slight differences in gravity between several of the minerals, obtain sharply demarcated products; hence, it can never be more than partially successful. Even supposing the hulk of the galena to be capable of close separation, a large proportion of the silver would still follow the blende and thus be lost in the subsequent treatment of this mineral for the commercial production of spelter.

Present systems consist, therefore, in the mechanical separation of the largest yield of galena which shall carry only such blende as is incapable of giving rise to serious smelting trouble. These lead (silver) concentrates are smelted in the usual manner and constitute the only product of commercial value derivable from the ore. The other by-products are zinc middlings, siliceous tails and slimes; each is more or less contaminated with all the various minerals of the original ore. Thus, while the galena concentrates carries several per cent of zinc, the zinc middlings similarly hold large amounts of lead and silver, but are nevertheless of little or no present value; samples which have come before us have averaged 25% to 27% of zinc, about 12% of lead and ten to twelve ounces of silver. The slimes are more or less representative of the whole ore hulk, and may even be somewhat enriched in zinc and silver; large parcels dealt with by us have been as high as 25% zinc, 24% lead and twenty-six ounces silver; but the general run is lower, say, 20% to 22% zinc, 17% to 19% lead and fifteen to eighteen ounces silver per ton. Slimes are also at present practically valueless. Chairmen of the various mines are apt to describe these middlings and slimes as a reproach to the metallurgist, and to picture to their shareholders visions of the potential wealth which these huge accumulations represent, realizable when once the process for their successful reduction shall be discovered.

At the various Broken Hill mines reduction work is now limited to concentration, the lead concentrates being shipped to coastal smelting works, where they are reduced to hulkion with other purchased ores. Net recoveries do not probably exceed 60% to 75% of the lead and 55% to 65% of the silver; with the exception of small particles shipped to Europe periodically, no zinc is recovered, though on this point it is difficult to obtain figures.

The economics of the problem have not greatly altered from those outlined by Mr. Ashcroft in 1898, when he showed that, with the then metal prices, a profit of 15s was all that was realizable from an ore value of some £9 per ton. Since that date it is true that considerable fluctuations in prices have occurred. Zinc rose to £28, but, though

this was a useless boon to Broken Hill, lead appreciated to £16, and for a while permitted of good dividends. This period was shortly succeeded by a still more serious fall, lead receding to a lower level in 1901 than had been known for many years, while silver has recently touched its lowest recorded price. Indeed, in 1901 all the Broken Hill mines, with the exception of the Proprietary and Central Companies, were for a while shut down. Although both lead and zinc have exhibited a slow rise of late months, the general outlook cannot be considered much brighter than Mr. Ashcroft had to face in 1898. Nor do the ore supplies show any tendency to increase in value. An average of 17% lead, 24% zinc, and thirteen ounces silver per ton may now be regarded as a general type of available material.

The greatest advances of late years have been in the direction of magnetic separation. Various types of magnetic concentrators are now under trial and in use at the different mines, by which a closer separation is possible, and the further concentration of the middlings into what may be considered a very inferior type of zinc blende ore can be effected. The inferiority of these zinc concentrates lies in the continued presence of considerable percentages of lead, and frequently as much as one-third the silver originally held by the ore.

By one type of magnetic concentrator known to us the galena and quartz are obtained together, a more or less impure blende as the second product, and the hulk of the rhodonite in a third. The lead then undergoes wet dressing to separate the silica. Starting with 100 tons of ore, about 40 tons of blende product are obtainable, assaying 40% to 45% of zinc (about 70% to 75% of the total in the ore), about 7% of lead, and from ten to twelve ounces of silver. This product is bought in limited quantities by European smelters, but we are unable to say whether they pay for the silver or exact a fine for the lead. In this country nothing would be paid for the silver, and it is doubtful if the English zinc smelter would under any circumstances treat an ore containing 7% of lead. It is probable that on the continent this product is mixed with pure blende ore in order to reduce the lead to a possible smelting charge. Sixteen to twenty tons of galena concentrates are produced after water dressing, the first product containing about 75% of the original lead and 45% to 50% of the silver. The lead product is, of course, subject to the usual smelting losses, which may vary from 7% to 10%.

A second system, investigated rather with the idea of obtaining the richest mixed galena-blende product for our own use than with the object of effecting the sharpest possible separation of each mineral, was able to produce from zinc middlings (assaying 30% zinc, 8½% lead and twelve ounces silver) a mixed concentrate amounting to 65% of the original ore weight, and carrying 39% of zinc, 11½% of lead and fourteen and one-half ounces of silver, equal to total recoveries of 85½%, 87% and 81%, respectively. This was obtained by the mixing of a more with a less leady concentrate.

The foregoing is a brief sketch of the recoveries now obtainable in Australia, and given to indicate the possible scope of invention for remedying the unsatisfactory results realized even by the best systems of concentration.

In the cases of many huge deposits of complex ore known to exist in other localities, but hitherto unworked, present Australian methods would not necessarily be followed as preliminary steps in our own or perhaps other processes. The Broken Hill products and accumulations are the outcome of evolutionary concentration methods, but in many instances complex ores are capable of direct reduction without the need of mechanical separation, or at most but that of barren siliceous gangue if desirable.

In our search for a suitable reduction scheme we desired to confine our attention to dry processes in order to avoid the apparently insuperable difficulties attendant upon all wet methods. When it is remembered that the weekly production of ore from Broken Hill mines amounts to some 20,000 tons, and that the maximum density of zinc sulphate liquors practically allowable cannot reach much over 20%, the task of dealing with the huge necessary hulks of solution, and of leaching, filtration, concentration and precipitation, operations on such become appalling. Even then (electrolysis being as yet unsuccessful with aqueous zinc solutions) the result is only a product requiring dry distillation. Indeed, it becomes evident that the difficulties of wet recovery processes only really commence when the solution of zinc or other metal has been effected.

Dry processes are, of course, no novelty, as witness the efforts of the Smelting Corporation, of Ellershausen, Armstrong, Angel, Claus and many others in this direction. But we believe we are correct in saying that hitherto all dry processes have started with the intention of recovering the lead and silver in the first instance, while obtaining the zinc as a volatilization, or as a slag, or other residual product, for subsequent retreatment. We cannot, however, include in this category the recently introduced Phoenix process, which, if alone from the daring ingenuity displayed, is worthy of a class to itself.

In fact, zinc has always been considered as the objectionable element in the ore, and the efforts have almost invariably been towards its early elimination, with the hope—never yet realized—of a subsequent

economic recovery. The reasons for this attitude are easy to discern. These ores have always been considered primarily as lead ores, while those interested in the zinc industry who may have directed attention towards such have condemned them at once as unsuitable for treatment in zinc retort furnaces, owing to the fatal presence of lead in any product obtainable by dressing.

The difficulties in dressing leady zinc ores are shortly these: Foremost comes the destruction of the retorts by the reduced lead, this occurring mainly during the stirring out of the seconds from the pots, whereby the metallic lead is oxidized to litharge, with the inevitable result of the slagging up and holing of the retorts. Even could this be overcome, it is found in ordinary practice that lead tends to volatilize with the metallic zinc vapors in such quantities as to materially damage the spelter produced. Finally, if lead were capable of complete elimination from the ore, we would still have the question of the silver to deal with, which, as we have shown, largely follows the blende, and would, in the usual routine, be lost both in the seconds (similar to the lead) by partial volatilization in zinc vapors.

(TO BE CONTINUED.)

Coal Pocket Elevator and Conveyor.

The illustration herewith presents a system of coal-handling machinery of modern and improved type for coal pocket situated inland, where the supply has to be taken from railroad cars.

The illustration was taken from a recent installation for Van Horson & Bertine, Mount Vernon, N. Y., and represents a type of elevator known as "continuous huckets," feeding from a pit under the track direct to the turret of coal pocket, and at that point discharging into a scraper conveyor, by which means

Coal Pocket Elevator and Conveyor.

the coal is carried to any one of the different storage bins and discharged through a gate.

The simplicity of this form of machinery and its low cost are important considerations, while at the same time the efficiency is high and the loss by breakage reduced to a minimum.

The type of elevator shown and described is one in which the coal is not thrown by centrifugal force when discharging at the head, but simply spills from the huckets, and, with a short drop, is lodged in the conveyor and carried along to the particular bin for which it is intended.

This apparatus was installed by the Jeffrey Manufacturing Co., whose works are at Columbus, Ohio.

Various modifications in the forms of this machinery enables the manufacturers to adapt it to a wide range of work, and when plans or sketches are submitted estimates and complete drawings will be furnished to intending purchasers.

THE requirement of annual labor on unpatented mining claims is not optional with claim owner. It is imperative if the locator wishes to hold the claim.

A Mexican Mill and Patio.

Many millions of ounces of silver and gold have been recovered from ores in Mexico during the past three centuries by primitive methods and slow processes. While the arrastra and patio are still a marked feature of metallurgical operations in Mexico, many changes are taking place. Old Mexican methods are giving place to modern American prac-

The Pride of the West M. & M. Co., Washington, Ariz.*

Written for the MINING AND SCIENTIFIC PRESS by JESSE SCOHEY.

The Pride of the West M. & M. Co., operating at Washington, Santa Cruz county, Arizona, is one of the unique companies of Arizona, from the fact that they are operating on a most complex ore and are

breaker and rolls falls into a 50-ton storage bin, from which it is automatically fed by an improved feeder of the plunger type, devised by M. H. Clagett, into a chute leading to the bottom of the second 12-inch elevator, identical with the first, but discharging into 36x60-inch, 12-mesh steel wire trommels. The oversize from these goes through dividers to two 14x37-inch Davis belted rolls running 120 revolutions, and discharges into the same 12-inch elevator by which

Old Arrastra, Etzatlán, Jalisco, Mexico.

tice and many old mines are again being operated under the direction of American engineers. The two accompanying photos are typical representations of an old arrastra and a patio in its walled enclosure at Etzatlán, State of Jalisco, Mexico.

Topography of a California Oil Field.

The two accompanying halftones will convey better than a written description an idea of the topography and general features of the oil-bearing territory

making three distinct commercial products in one milling operation that comprises dry crushing, roasting, magnetic separation, wet concentration, drying and smelting.

The property was developed and the treatment evolved by A. R. Wilfey, president of the company, who is prominently identified with ore treatment from his invention of the Wilfey table. The company is a Colorado corporation, with John S. Cary vice-president, Herbert E. Fiske secretary, and A. R. Wilfey, John S. Cary, Frank L. Smith, Emerson

they are fed.

The undersize from the 12-mesh screens, comprising all the fines of the ore, the fines produced by the rock breaker, the coarse rolls and the fine rolls, is accumulated in four bins holding about 100 tons, although in continuous operation the ore falls directly through these bins and onto a 16-inch, 4-ply rubber belt conveyor 80 feet center to center, running 113 feet per minute and carrying the ore through the second floor of the mill, where it discharges into the hoppers of a 12x120-foot Holthoff-Wetthey calcining

Oil Formation, San Emidio Canyon, Cal.

Oil Formation, San Emidio Canyon, Cal.

about San Emidio canyon, Kern county, Cal. These hills of sandstone and shales are rounded and usually covered with a thicket of brush, but in some portions of the district the slopes are abrupt and even precipitous.

Power in South Africa.

It is reported that the industrial conditions in South Africa demand the development of a large amount of power, and, as a matter of course, water power is preferred. This will develop electrical power which can be transmitted to any point within the range of possibilities. There are numerous large waterfalls on all the large streams of Africa, particularly on the Congo and its affluents and on the Zambesi river. On the latter stream the Victoria Falls is the largest in the world—larger than Niagara. It is about a mile wide and 420 feet high. Even in dry seasons the water is from 2 to 3 feet deep at the crest of the fall.

FUEL can be economized by putting a damper in the smokestack, and a further saving can be effected by passing water through a cylinder heated by the exhaust steam from the engine. It never pays to pump or otherwise force cold water into a steam boiler.

Gee, Herbert E. Fiske, Robert J. Cary and John J. Broughall as directors. The present operations are controlled at Washington by Jesse Scohey, general manager, and Herbert M. Clagett, superintendent.

The original claim of the company was the Pride of the West, acquired about 1896, and is now one of a group of nineteen claims, showing a prominent mineralization along a granite and limestone contact, with intersecting porphyry.

The milling ore has an average composition of 5% copper, 11% zinc, 7% lead, 20% garnet, 30% silica and 2% lime, and is mined from large lenses, raised through a main incline to the main tunnel level, and from there trammed to the head of a gravity skip, which lowers the ore to the main ore bin of the mill. This bin is also fed by teams hauling from the different workings not connected with the Pride incline. The ore is fed by hand into a 10x20-inch Blake crusher and elevated by a 12-inch, 8-ply rubber belt elevator with cast malleable cups to a 36x80-inch, 4-mesh steel wire cloth trommel, running thirteen revolutions, from which the oversize returns by gravity through a storage bin to a 16x36-inch Davis belted roll running eighty revolutions and discharging into the same 12-inch elevator above mentioned as relieving the rock breaker. The undersize from the rock

furnace. The hearth of this furnace was specially constructed under instructions from A. R. Wilfey for two distinct duties. The crude ore first falling from the hoppers onto the hearth is rahlled a distance of 78 feet, with a chain speed of 57 feet per minute, past two staggered fireboxes fired with wood, consuming seven cords per day of twenty-four hours. Here the hearth is broken for 10 inches, allowing the roasted ore to fall to the cooling hearth below, to be cooled and rahlled back to the same end of the furnace whence it was fed. The remaining 42 feet of hearth is used for roasting copper concentrates previous to smelting, and is fired by the third firebox, consuming four cords of wood per day of twenty-four hours, the spent flame from which continues along the hearth and assists in roasting the crude ore. This latter part of the furnace is fed from an 8-inch, 4-ply belt conveyor, 92 feet center to center, running 85 feet per minute, directly over the furnace, and carries the copper concentrates made by the magnetic separators. The concentrates are here roasted to 7% to 10% sulphur and discharged into bottom-discharge ore cars and trammed to the smelter.

The roasted crude ore is discharged from the cooling hearth of the furnace onto a Wilfey shaking conveyor with steel pan 14 inches wide by 30 feet long and carried to a 6-inch rubber belt elevator with cast malleable cups running 302 feet per minute and ele-

* See illustrations, page 334.

vated 37 feet to a cooler, devised by H. M. Clagett, consisting of a series of connected pans 36 inches wide, operated by a Wilfley movement, whereby the ore is spread to a thin film and exposed to the air in a thin, falling stream as it is shaken from one pan to the other. This machine tends to reduce the temperature of the roasted ore to the lowest possible point, as the magnetic susceptibility of the minerals varies inversely with the temperature.

From the cooler the ore is taken by a second Wilfley conveyor specially constructed to cut out variable proportions of ore, and is divided and distributed to four bins that feed directly each to a Wetherill 4-pole magnetic separator. These four machines perform the same duty, each handling twenty-five tons of crude ore per day. All poles carry 110 volts. The first two poles of all machines consume three amperes, while the last two require five amperes. The main 16-inch feed belts run 95 feet per minute; the first two cross belts run 356 feet per minute, the last two 276 feet per minute. All four poles perform the same duty, lifting the roasted chalcopryite and iron and discharging tailings carrying all the lead, zinc, garnet and silica.

The chalcopryite falls from these machines to an 8-inch, 4-ply rubber belt conveyor, running 69 feet per minute, discharging into the hoot of a 6-inch rubber belt elevator that discharges onto the 8-inch conveyor previously mentioned as running directly over the roaster and discharging into the further half.

The tailings from the magnets discharge into a bath of water, from which radiating launders carry the pulp to five standard Wilfley tables, where the lead and zinc are concentrated at the head of the table, while the zinc and garnets are discharged as middlings. The silica and some garnets are discharged as tailings into a concrete sluice running through the center of the table room.

A Wilfley shaking conveyor runs the length of the table room along the head end of the tables, and receives into one compartment the lead and zinc concentrates, and into the other the zinc and garnet middlings. These latter discharge into the hoot of a 4-inch rubber belt elevator, equipped with special cast copper cups, which elevates and distributes the middlings to two Wilfley tables that concentrate the zinc at the head end and discharge a proportion of the garnets into the tailings sluice. The zinc falls into the compartment of the shaking conveyor that carries the lead and zinc, and all are carried forward to a second 4-inch rubber belt elevator, with cast copper cups, which discharges to two more Wilfley tables. Here the lead is concentrated to 70%, with from 100 to 120 ounces silver. The zinc-garnet tailings are in this instance sluiced to a special drag box that is equipped to drag the moist mineral that settles to the bottom out from the water and up to an altitude that enables it to fall by gravity to a dryer, using exhaust steam as a heating medium. The water from the drag box overflows into the main tailings sluice.

The dryer consists of a pan 30 inches wide by 60 feet long, upon which the wet ore falls at one end and is rahlled forward by staggered rahlles traveling 35 feet per minute, and discharging the pulp—dry—into the hoot of a 6-inch rubber belt elevator. The ore is here raised to the second floor of the mill, where it is screened over a 12-mesh cloth attached to a Wilfley shaking conveyor. The oversize is waste, and the undersize is dropped into the 10-inch pan of the conveyor and carried in a divider into two bins, each feeding a 6-pole high-power Wetherill magnetic separator.

These two machines perform the same duty, each on fifteen tons of the zinc-garnet tailings. They carry 110 volts on all magnets. The first two poles are set to four amperes, the second two poles to ten amperes, and the last two at twenty-five amperes. The main feed belts run 31½ feet per minute, while the cross belts run 218 feet, 187 feet and 171 feet per minute, respectively.

The first two poles lift any chalcopryite that may have escaped the original four machines; the second two poles lift the garnets that were concentrated with the zinc, and the last two poles lift the clean zinc. The tailings from these machines are an inconsiderable amount, but consist of any silica or lead that may have escaped the concentrating tables. This material is then rerun when a sufficient quantity has accumulated.

The zinc, 50% pure, is shipped to Belgium and the lead concentrates are shipped to Philadelphia. The copper concentrates, after being roasted and delivered to the smelter, are combined with an equal weight of crushed carbonate ore and stored in three charging hoppers over a 14 foot, 6-inch by 29-foot, 6-inch reverberatory smelter. This furnace until quite recently used wood exclusively as fuel, and required nine cords of black oak and eight cords of juniper per twenty-four hours. The wood having become scarce, fifteen cords of black oak are now used per day, with six barrels of California crude oil. The oil flows by gravity in three small streams through holes in the arch of the firebox and falls directly on the burning oak. This furnace smelts six charges of seven tons each, or forty-two tons of ore per day, into 60% matte, which is at present being shipped to New York.

A scarcity of water necessitates the most careful use of all available water. Seventy-five tons of tail-

ings from the magnetic separators are washed over Wilfley tables with a consumption of only 6000 gallons per day, which represents a loss of only 2% of all the water required. This is in the table tailings, which are discharged with 25% moisture. The accumulated table tailings are elevated by a 12-inch rubber belt, equipped with special cast copper cups, and discharged into a drag box designed by Jesse Scohey for this work. The box is an inverted pyramid 5 feet deep, with a base 7x10 feet. There is a false hack along the 7-foot side that receives the pulp from the elevator and carries it down to the bottom of the box, delivering it under a 12-inch pulley, over which runs a belt equipped with cast copper drags. This belt runs 30 feet per minute and slowly drags the settled pulp up one edge of the pyramid at an angle of 35°, allowing the contained water to drain back, and discharges the moist pulp into a small bin, from which it is wheeled to the dump. The box has a settling surface of 40 square feet and is not disturbed by the belt, which is, for the most part, under the water at the bottom of the box. The settled water is drawn off over a haffleboard 6 feet long at the wide side of the pyramid receiving the pulp.

The slimes water for a time defied all attempts at settling. It was led into a shallow tank 14x19 feet by 2 feet deep, divided into three compartments, so that two were used while the third was being cleaned. The two tanks in use formed a settling surface 6 feet wide by 29 feet long, but as the water after passing through this was still too foul for use it was led into an additional settler consisting of a tank 16 feet in diameter by 16 feet deep. The pulp was fed into a 12x12-inch closed chute that discharged within 2 feet of the bottom of the tank. The clear water was drawn over the top of the tank into a launder surrounding the tank on the outside. A small stream of thick slimes was drawn continuously from the bottom of the settler. The water overflowing the 50-foot periphery is absolutely clear, and is drawn into a subsidiary tank filled with old iron, which precipitates the copper sulphate held in solution.

It was found that after washing the ore some of the roasted copper escaping the magnets was taken up by the water as copper sulphate. This attacked all the iron parts of the table, and especially the iron cups of all elevators, so that, as above noted, all wet elevators and all parts exposed to the water are now constructed of either wood, rubber or copper.

The plant is operated with three horizontal tubular boilers, supplying a 12x24x30-inch tandem compound Allis-Chalmers engine. There is a 40 H. P. slide valve engine used as an auxiliary in case of shut down to supply the dynamos for lighting. All exhaust steam from every pump or engine at the mill, or hoists at the mines, is connected with the condensing system. This is made up of three units, all open one into the other, but all discharging under water into the tanks from which the boilers are supplied. The steam dryer condenses about 10 H. P. in drying twenty tons of ore per day. The air condenser, consisting of 2826 square feet of exposed surface, contained in a cooling tower 50 feet high to create a draught, condenses about 15 H. P. The remaining exhaust steam is carried through a 10-inch galvanized pipe to the main water supply tank above the works. This tank is of iron, 50 feet in diameter by 5 feet deep, and is equipped with 750 square feet of condensing surface in 2-inch pipe coiled in the bottom of the tank. All water used in the plant is pumped into this tank from wells 1½ mile from Washington. The tank is 350 feet above the mill, so that an ample head and supply are maintained in case of fire. The plant is fully equipped with fire hose located at such points as will command all parts.

Mexican labor is employed in every department, and is found efficient, intelligent and reliable. The company maintains a well-stocked department store, directed by H. R. Renshaw, which issues all supplies to the mines, mill and smelter, and also trades with the people of the town and the surrounding cattle districts. Washington is reached by stage lines from Patagonia or Nogales.

Washington, Ariz., Dec. 2.

Magnetic Concentration of Ore.

In the process of concentration by means of electrical magnets the ore is delivered by an adjustable chute between two magnetic poles, the upper one of which (the north pole) is rotated. As the ore arrives in the magnetic field the permeable particles are attracted by the north pole and are carried around by it into zones of progressively diminishing intensity until the centrifugal force imparted to the particles overcomes the magnetic attraction and they fall into collecting chutes, being classified according to their magnetic properties. The non-magnetic material falls directly into a chute close against the lower pole. This arrangement is claimed to have the advantages of dispensing with belt carriers, which weaken the magnetic field, and also of permitting the use of small magnetic fields and very narrow air spaces, thus minimizing the loss of energy and making it possible to attract feebly magnetic particles by a very weak current. The rotating pole being the only moving part of the machine, wear and tear is very small. In separating blende and siderite from the Upper Harz,

the grains being of 0.5 millimeter size, 98.7% of the zinc has been recovered. With dolomitic Silesian blende of 2 to 3 millimeter size, the recovery was 91.8%, which was increased to 93.5% by reducing the grains to 2 millimeters. In treating ore from Broken Hill a yield of 81% of the lead and 69% of the zinc was obtained.—Electrical Review.

Mining and Metallurgical Patents.

Patents Issued December 2, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

HOISTING APPARATUS.—No. 714,701; C. W. Hunt, West New Brighton, N. Y.

In a hoisting apparatus, combination of hoisting ropes, separable guides for ropes respectively and drums connected respectively to guides to effect movement thereof, one drum having portions of different sizes whereby the rate of movement of one of guides with respect to other is varied during movement of both guides.

PROCESS OF SHUTTING OFF WATER IN DRILLED OIL WELLS.—No. 715,141; W. Piotts, Whittier, Cal.

Method shutting off water in drilled oil wells, which consists in drilling larger hole to short distance below water-bearing stratum which it is desired to shut off and casing same; then drilling smaller hole in bottom of larger hole down into the oil sand and putting in casing in smaller hole; after which larger casing is loosened and kept moving up and down; feeding packing material between casings and tamping packing material around inner casing below water-bearing stratum by movement of outer casing; then feeding between casings a puddling material and tamping puddling material around inner casing upon packing material by movement of the outer casing.

SETTLING TANK OR DECANTING VESSEL.—No. 714,822; J. Randall, Deadwood, S. D.

Settling tank consisting of body having vertical side and bottom formed of slopes, different inclinations, provided with central outlet, side having cutaway portion forming an overflow lip, launder en-

circling lip and provided with discharge spout, baffle plate of cylindrical form connected by strips to upper portion of side and extending into tank below top nearly to lower edge of side, and pipe leading from central outlet.

ORE CONCENTRATING AND DREDGING APPARATUS.—No. 714,755; A. B. Stetson, Milwaukee, Wis.

In an ore concentrating combination of plurality of longitudinally inclined shaking screens; intermediate shaft and eccentrics adapted to simultaneously reciprocate screens in opposite directions; distributing pan provided with foraminous bottom, below series of screens; deflecting plate with oppositely inclined sections below distributing pan; series of concentrating surfaces each side of deflecting plate; series of longitudinally extending spray pipes above shaking screens; conveyor for receiving and carrying away heavy waste material from screens.

PROCESS OF ELECTROLYTIC SEPARATION OF COPPER AND NICKEL.—No. 714,861; D. H. Browne, Cleveland, Ohio.

In the art of copper separation, process which consists in treating copper-nickel matte to form copper-nickel alloy free from sulphur; treating alloy with chlorine and solvent for cuprous chloride.

MAGNETIC SEPARATOR.—No. 715,160; C. Scholl, Goppingen, Germany.

In magnetic separator, rotary separating drum in combination with series of electromagnets for producing partial magnetic field on surface of drum; rotary sectional current distributor ring; two brushes for supplying current of one polarity and so arranged as never to impinge against adjoining distributor sections, third brush impinging against an intermediate section and arranged to supply current

of opposite polarity, connections between coils of electromagnets and sections of current distributor, whereby current is fed only to portion of coils; and portion of surface of separating drum is thus constantly non-magnetic.

PROCESS OF OBTAINING METALS FROM THEIR ORES.—No. 714,914; N. S. Keith, Arlington, N. J.

Process of separating metal from ore and gangue, which consists in grinding ore and gangue with carbon; heating ground mixture in open furnace, containing atmosphere of reducing gases, to temperature of fusion of particles of ore only, and submitting thus treated mixture to mechanical concentration to obtain the metal.

ORE ROASTING FURNACE.—No. 715,080; A. C. Johnson, Baltimore, Md.

In combination with cylindrical shell, cylinder heads having flanges extending over shell bolts fastening heads together, tiling within shell, shelves arranged in reverse directions and inclined blocks projecting from tiling to support shelves, shafts projecting from ends of furnace, pipes for conveying gases from furnace, and means for rocking latter.

EXTRACTING METALS FROM COMPLEX OR SULPHIDE ORES.—No. 715,024; J. C. Clancy and L. W. Marsland, Sydney, New South Wales, Australia.

Process of extracting and recovering gold, silver, lead, zinc and other metals from mixed or complex sulphide ores consisting essentially in following successive operations, heating ore with addition or admixture of lead sulphate in a cupola or blast furnace so as to convert required amount of lead and whole of zinc and other volatile metals contained in mixture more or less wholly into fume, spraying dilute sulphuric acid upon fume and gaseous products of decomposition to convert fumed metallic oxides into their corresponding sulphates, recovering lead sulphate used for mixing with ore and zinc and other

volatile metals from sulphates deposited in first named or fume chamber, recovering metallic contents from residue remaining in furnace by smelting.

BUCKET DUMPING APPARATUS.—No. 715,228; W. R. Wilcox, Saratoga, Wyo.

In bucket-dumping apparatus, combination with suitable frame, bucket provided with depending ring attached to bottom, device suspended on frame and composed of two separated arms, part connecting arms and bowed outwardly therefrom on one side, device pivoted between arms at lower extremities, provided with hook, bucket provided with ring adapted to automatically engage hook of device as bucket is lowered to position thereon, pulley located at upper extremity of device and adapted to be engaged by bucket-hoisting cable, link connecting upper extremity of device with frame beyond plane of bucket-hoisting cable.

The Most Economical Engine.

What type of steam engine will supply power most cheaply? The scientific man, and the theoretical, said the London Engineer, in a recent discussion of this question, will naturally jump to the conclusion that the engine which uses least steam per horse power per hour will best satisfy the conditions. But the steam user has only too good reason to know that the question is much too complicated to be answered in that way. Taking coal to cost one-tenth of a penny per pound or a little over a sovereign per ton—a reasonable price for steam coal—it will be seen that if 1000 I. H. P. is obtained for an hour with 2000 pounds of coal the cost is 17s 6d. A reduction in the consumption amounting to the not inconsiderable figure of 14% would represent a saving of but half a crown. It is in no way certain that in the long run, of two engines, one using 14% less steam than the other the first would be the better engine to have. It might be or it might not be.

There are, however, certain broad principles which will serve to guide the engineer. It will usually be found that high economy means, if not complication, at all events an increase in the number of parts, and a high steam pressure. To these things there is no objection so long as it is fully understood that they demand superior material and very excellent workmanship. The highly economical engine must, therefore, be comparatively an expensive engine. If it is not expensive at first, it is sure to be costly in the long run. Thus, for example, with high-pressure steam and a high piston speed, it is essential that the cylinder liner metal, particularly if the engine is horizontal, shall be as hard as is compatible with boring. This means that the liners will cost a good deal of money. If soft metal is used, the result will be serious. Furthermore, it must never be forgotten that the primary condition of working is that the engine shall never cease running until the engineer in charge stops it. That is to say, it must not get hot bearings or break down in any way. Now, engines with complicated valve gear are not invariably trustworthy in this respect. They are not trustworthy at all unless they are extremely well designed, made and maintained. These and various other considerations all point to the one end. The very economical engine must be a very fine piece of mechanism, and it must be taken in charge by competent men. It is the old story of the astronomical regulator and the kitchen clock over again.

If, now, the engineer is told that he can have the economical engine for the same price, or nearly the same price, as the engine of a simpler type, he will do well to regard this statement with suspicion. It is quite possible to build a cheap engine which will give a very high result for a short time. In the end it will prove a weariness to the flesh of everyone who has to do with it. On the other hand, the first cost, and the other costs involved in the purchase and use of a very economical and beautiful engine, may be so great that the saving effected in fuel will not compensate for the augmented outlay. Anyone ought to see at a glance that at this point we are brought face to face with the cost of coal, and thus an engine which might be highly desirable in one place where fuel may be very dear might not be at all the best in the center of the coal fields.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

NOME.

(Special Correspondence).—There are 2500 people left in Nome to winter after the exodus has ceased. The Corwin will take seventy-five to-morrow. Everybody remaining here is busy preparing for extensive winter digging, not only in the Nome district, but also in the Solomon River, Ophir Creek and even the Kougruk districts. Besides, work is being pushed on the different ditch systems, to get supplies and lumber on the snow to their destination before the severe cold shall make work more disagreeable. The quartz mill of Mrs. Lane has been landed at the mouth of Solomon and is being hauled on sleighs to Big Hurrah creek; the contract for the erection of the stamp mill calls for the same to be completed and in running order by June 1, 1903. The shaft is now 65 feet deep, at which depth the ledge is 8 feet wide and seems to be widening. There is \$100,000 ore in sight. Solomon river benches are being opened up and preparations are being made to work them this winter season. On Nos. 9 and 10, below Discovery, a good-sized pay streak has been discovered that runs as high as 25 cents to the pan. The lower part of Solomon river has also some new discoveries.

On Mystery creek, tributary to Shovel, are at present six camps, all of which intend to do winter work. On Nos. 5 and 6, and the benches off Nos. 7 and 8, above, have some pretty good indications for a good pay streak.

Ophir creek, tributary to the Neukluk river, is going to be a good producer the coming winter season.

The benches have proven the last summer season to be as good as the creek, and a number of camps will be working in that creek. C. D. Lane is constructing a flume from the head of Ophir to No. 15 above; the hauling of lumber to that place will occupy a large force of men all winter.

Council City, at the mouth of Ophir creek, is a typical prosperous mining camp. Everybody seems to have had a good season; money is plentiful, and business men, as well as property owners, are looking forward to a good winter season.

There is a new ditch in course of construction from the head of Nome river to Buster creek, on the left limit of the river. Great beds of gold gravel have been discovered on the blislands at the head of Nome river, which it would not pay to handle with the crude methods of pick and shovel, but which will pay immensely if worked by hydraulic methods.

Peeluk creek benches are being worked; several shafts have been started the last few weeks. Otter creek benches on both sides of the creek are being opened up. On the Jefferson claim a body of wash gravel 20 feet deep has been found, and the probabilities are that a big dump will be taken out before next spring. A defined pay streak of beach gold has been traced from No. 3 on Peeluk creek, across Martin creek to Otter creek, and thence to Hastings creek, and many mine owners contemplate to work on this streak the coming winter.

A body of pay gravel on the benches off No. 3 above, on Bourbon creek, at a depth of 75 feet, has been found, which will average 3 cents to the pan.

Dexter and Anvil creeks have the usual force of men employed on the benches, and are all doing well.

The latest strike is reported from the given-up Kougruk. On Dahl creek, No. 2 above, Mr. Olsen, brother of the San Francisco grocer, has a large body of pay—\$8000 reported on one day's cleanup—and also that he had one pan of dirt which went as high as \$220; that the gold can be literally seen in the frozen ground.

Good reports come from the Inmatchuk river, a tributary to Good Hope bay. People returning from that section have all good-sized pokes.

Nome, Nov. 9.

The Alaskan-Rodman Bay Co., of London, has bought nine claims in the Dewey group of gold mines on Rodman bay, with stamp mills, equipped with water power and electricity, and 7 miles of railroad for \$297,500.

Work has been resumed on the Kensington tunnel at Seward. T. S. Nowell says the work may be let by contract.

At the Ebner mine, in Silver Bow basin, ore is broken to feed the mill for more than a year, and thousands of tons in reserve in the mine. It is reported that fifty stamps are to be added to the recent order for a mill.

The Alaska-Juneau G. M. Co. have secured a millsite in Silver Bow basin and

arrangements are being made for 100 stamps. It is reported that the old mill will be moved to the new site and 100 stamps added.

ARIZONA.

COCHISE COUNTY.

A. Bauer of Bisbee is developing a copper prospect in the Solomon Springs district. The shaft is wholly in ore, its width not having been learned.

The gallows-frame on the new shaft of the Bisbee West is in place, also the new engine. An addition of twenty men will be made. General Superintendent Dwight says the shaft will be sunk 1000 feet.

The mines of Tombstone are being unwatered and rehabilitated by the Tombstone Con. Mines Co., Ltd., under the supervision of the Development Co. of America, whose board of directors is composed of B. P. Chessey of Boston, R. A. Alger of Detroit, N. K. Fairbank of Chicago, F. M. Murphy of Prescott, Ariz., and others. The Tombstone Con. Mines Co., Ltd., was organized last year, and has bought up all of the productive mines of the district, comprising 97% of the ore output prior to the suspension, at a cost of nearly \$10,000,000. It has hauled from Fairbank on the railroad to Tombstone, 8 miles, between thirty and forty carloads of machinery, including four boilers 200 H. P. each, weighing twenty-five tons each. Its pumps were made by the Prescott Pump Works of Milwaukee. The hoist, 79 feet high by 39 feet square, sets upon granite piers. The pumps are more than double the capacity of those installed in 1886, which lowered the water with ease.

At the Lowell mine, near Lowell, pumps will be installed and another compartment is being added to the double compartment shaft. They are raising from the level upon which the pumps will be put.

The Calumet & Arizona Co. is shipping ore to Douglas, where their smelter has been blown in. A number of automatic, self-dumping ore cars have been put on between the mine and Douglas.

GRAHAM COUNTY.

The Era says the Chase Creek C. M. Co. has incorporated to operate property in the Greenlee district. They have secured forty-four claims, all but four of which lie in the belt between the Longfellow mine, and the properties of the Clifton Con. and New England C. Co.'s holdings on Chase creek. The main tunnel will be started from the creek, and others will be run farther back. I. N. Stevens is manager.

P. F. Crowley is shipping ore from the Antietam claim, near Metcalf. The shaft, 7x9 feet, is in ore. At 70 feet he ran a drift 48 feet in ore which averages 10% copper and some gold.

Sixty-five tons of 25% copper ore were shipped from the Standard copper mines last week to the smelter.

Manager Woulf of the Polaris M. Co. says he will soon have the properties developed enough to start up their 20-stamp mill at Evans Point.

MARICOPA COUNTY.

The Illinois Copper Co. at Wickenburg are taking out silver-copper ore at the White Cap group, showing glance, grey copper, azurite, malachite and molybdenite.

MOHAVE COUNTY.

S. Bedell of Needles, Cal., says the Mohave G. M. Co. of Boundary Cone mines, will build a 40-stamp mill at Mellon on the east side of the Colorado river, and twenty carloads of machinery are now at that point. A branch railroad will be run from Mellon to the mines, 16 miles in length.

PINAL COUNTY.

The Gila-Pinal Mines Co. is laying a pipe line 4000 feet long and laying in a large wood supply at their mill on Mineral creek, near Kelvin. The company has bought the old Bobtail mines and will resume operations. Twenty-five miners will be put on at the Bobtail.

F. A. Adams and W. Bley are at Riverside working on their gold property, 2 miles above Riverside station. They are running a crosscut tunnel. The surface ore prospects in gold.

YAVAPAI COUNTY.

Superintendent M. S. Taft of Victor mine, on Lynx creek, near Mud Hole, reports a strike of native silver, says the Prospect. Men were drifting from a 30-foot crosscut, 300-foot level. In addition to the silver this crosscut vein runs \$3.50 in gold.

Prospecting is active at Mint valley, 12 miles northwest of Prescott. Several shafts are being sunk and some good gold ore found. Prospecting work was done on Bald hill in this vicinity several years ago and gold found, but the properties were abandoned.

In the miners' drilling contest at the carnival at Prescott last week, Malloy and

Ross of Bisbee, who drilled 34.55 inches, won the double-hand prize of \$150. T. Ross of Colorado won the single-hand prize of \$75, with 17.01 inches.

A hoist has been shipped to the properties of the Alta M. Co., in Eugenia gulch, near Prescott.

Superintendent M. Bradley, of the Lion mine on Cherry creek, says he is taking pay ore from the Lion. The Huntington mill is being overhauled.

Superintendent Pickrell, of the G & C. Con. M. Co., has fifteen steel tanks in the cyanide plant in place and four others have arrived. The plant is 12 miles south of Prescott.

The newly elected directors of the Baumann C. Co. are: H. P. Anewalt, R. E. Sloan, R. E. Morrison, J. Baumann, W. S. Goldsworthy and J. C. Martin, of Prescott, and E. Hart, of Gallup. The officers are: Pres., H. P. Anewalt; Vice-pres., R. E. Morrison; Secy. and general manager, J. Baumann; Treas., W. S. Goldsworthy.

H. C. Clark, of the Rigby M. & R. Co., of Denver, has been surveying a site for the erection of a mill of 100 tons daily capacity at Mayer. It will be the first custom plant to be put up. Contracts for the erection of the plant will be let.

YUMA COUNTY.

A group of mines in Quartzite district has been bonded by G. W. Norton of Mohawk. Development work has begun. The ore carries lead and silver.

The Success Copper Co. of Los Angeles is developing the Goodenough mine, 12 miles southeast of Quartzite. A 25 H. P. gasoline hoist is in place.

The tunnel, 170 feet, on the Desert Queen, near Quartzite, having reached the vein, it has been decided to start another at a lower level. The mine is equipped with 40 H. P. gasoline engine, air compressor and machine drills.

The Yuma Sentinel says the water supply for the King of Arizona mine comes from three wells each 1000 feet deep. The wells are 5 miles from the mine and 700 feet lower, and the water is pumped to the mine and costs the company one-tenth of a cent per gallon.

CALIFORNIA.

ALAMEDA COUNTY.

A site for an oil refining plant has been leased in Alameda at the foot of Fruitvale avenue, on the tidal canal. The plant, besides refining low-grade oils, will manufacture roofing material, creosote, tar, etc.

AMADOR COUNTY.

Superintendent C. E. Purrington, of the Fremont Con. M. Co., near Amador City, is arranging to put up a 40-stamp mill and boiler and hoist.

The Dispatch says C. D. Lane has men at work on the Orr property on Indian creek, near Plymouth.

J. Oneto and H. H. Deacon, Jr., of Sutter Creek, will place a 10-stamp mill on their property above Pine Grove, east of the Defender.

The Mugford ranch of 161 acres, 2 miles east of Sutter Creek, has been bought by a member of the Imperial G. M. Co., which owns the King ranch on Sutter creek. The new purchase adjoins the latter property.

A long drain ditch has been dug and extensive preparation otherwise made to work this part of Sutter creek. It is one of the few pieces of ground on the creek not worked out by early miners.

At the Defender mine, 7 miles above Pine Grove, the new 10-stamp mill has started up. Since the burning of the 4-stamp mill the mine has been opened to the 300 level, and bins are filled with quartz. The ledge averages several feet in width. The old mill turned out \$55,000 during the period it was running. The last shipment of ore made to Selby's returned nearly \$100 per ton. F. B. Joyce, superintendent and manager, owns a three-quarter interest.

BUTTE COUNTY.

The Indian Spring mine near Magalia is reported sold to the Bay Counties Power Co.

Rideout & Co. are timbering the old Pershecker tunnel.

The Evolution mine near Magalia, recently closed, will reopen. F. William is superintendent.

CALAVERAS COUNTY.

Angels Record says that within the past year sixty stamps have been put in at the Melones, and sixty in contemplation the coming year; ten at the Duchess; five at the Sugar Pine; twenty at the Angels; ten at the Oriole; twenty new stamps will soon be added to the Lightner and ten more to the Sultana, making a total of four hundred and twenty-five stamps within a radius of 7 miles of Angels.

W. T. Robinson and E. L. Burns, of Mokelumne Hill, who are prospecting the opal-bearing formation on Stockton ridge, have found in the face of the tunnel two parallel strata, 3 feet apart, both of which contain opals. In the upper stratum the

opals were "dead," or nearly chalky. In the lower one, specimens were found which show some fire.

EL DORADO COUNTY.

Near Placerville, the Craddock 2-stamp mill has resumed.

FRESNO COUNTY.

The Union Oil Co. is making contracts to pipe oil from the Upper San Joaquin oil field to Monterey bay. The line will be about 125 miles in length when built, and is estimated to cost \$250,000. W. L. Stewart is general manager of the company.

KERN COUNTY.

Superintendent McMahon says twenty tons from the Wedge mine of the Con. Mines Co., near Randsburg, milled last week, returned an average of \$75 per ton. This ore came from the crosscut on the 350-foot level.

The Merced mine, in the Stringer district, near Randsburg, has been sold to Ventura men. R. W. Cloud is superintendent.

G. Boydston, H. Hough and J. Batschewald, who are working the Pearl Wedge mine, near Randsburg, sent eight tons of ore to the Atkinson mill last week, which returned \$750.

The Peerless Oil Co. has two wells, Nos. 5 and 17, drilling, one down 400 and the other 500, and a third, No. 17, rigging to begin.

LOS ANGELES COUNTY.

The Sespe Canyon Oil Co. last week struck oil at a depth of 615 feet, 30 feet in the sand.

MARIPOSA COUNTY.

J. L. Brown has discovered a placer deposit, of which he says: "The claim is 4 miles above Bagby's, on the south side of the Merced river, opposite Sherlock's Flat. We have drifted in the channel 40 feet and the gravel will pay 50 cents to the wheelbarrow. A thousand feet of flume will be built. We will have a water supply for a working season of ten months a year."

NEVADA COUNTY.

The Herald says the Lecompton M. Co. has incorporated: T. D. Hicks, W. H. Dunlap, N. P. Brown, D. E. Morgan and H. H. Dunlap. Years ago this mine was a large producer, but the main shaft being located in a canyon, was filled by a flood. Since that time it has been worked in a small way by leasers.

A body of ore has been struck in the Red Bird mine, in Bunts canyon, 6 miles below Colfax. The mine is owned by G. A. A. Tubbs and T. E. Haydon.

The new mill at the Bonnie Bee mine, near Emigrant Gap, is nearly finished. The tunnel is in 480 feet. Over 2800 tons of ore is ready for the mill. Twelve men are on the pay roll. The Zeibright mine, 200 yards east of the Bonnie Bee, will build a 20-stamp mill next spring. Machinery is being hauled from Emigrant Gap to the Red Cross mine, 5 miles farther on the same lode.

At the annual meeting of the Pennsylvania M. Co., at Grass Valley, the following were elected: T. H. Wilhelm, pres.; D. E. Matteson, vice-pres.; J. M. Thomas, sec'y; B. Ople, supt.

SAN BENITO COUNTY.

The Watsonville Oil Co. has bought the rig, tools, etc., of the Gilroy Oil Co. and will use the outfit in drilling near the well drilled by them on the Sargent ranch, near Sargents.

SHASTA COUNTY.

The Free Press says in Shasta county there are 222 groups of mines, silver and gold. These groups consist of from one to eighteen claims. There are fifty-eight copper locations.

SIERRA COUNTY.

The Messenger says the Poker Flat M. Co., at Poker Flat, near Downieville, has stopped the work of hauling the mill on account of snow closing the roads, and will not be able to resume till spring.

A gasoline engine is being put in at the Swansea mine, near Alleghany, to run the air compressor.

The Bellevue tunnel, near Gibsonville, is in 4000 feet and going ahead 75 feet per week, says the Messenger.

At the Thistle Shaft mine, near Gibsonville, the tunnel now being run passed through the hard rock and the drills are working in softer material, requiring the use of timbers. This is regarded as indicating the proximity of the channel.

SISKIYOU COUNTY.

J. F. Boyle, in charge of the Quartz Hill mine on Scott river, is getting ready for mining in the spring. He intends putting up a saw mill.

A large cyanide plant is being built at the Dewey mine, Gazelle district, by G. W. Couper, under supervision of foreman, G. Brooks.

The Yreka Journal says F. M. Ballard has bought the Ironside quartz ledges, on

the divide between Greenhorn and Cherry creeks.

In the coal mine at the Herr ranch, between Yreka and Ager, the water level has been reached.

TRINITY COUNTY

The Bobs Farm quartz mines, consisting of sixteen claims in the Rattlesnake mining district, near Weaverville, has been surveyed for a new mill, and a tramway from the mine to the creek, three-quarters of a mile, to be put up in the spring. The owners are Montgomery & Byers.

TUOLUMNE COUNTY

(Special Correspondence).—The Draper mine, near Soulsbyville, is making a test run, using steam power. The mill is running two shifts. At Jacksonville the Clio is running ten stamps, taking ore from the 300 level, which has been drifted north and south about 150 feet. The rock is being hoisted to the 200 level, and thence is sent to the mill via the new tunnel. Formerly the ore was hoisted to the surface and sent to the mill by a gravity tramway. The Republican, near Jacksonville, is crushing rock in readiness for milling. The Longfellow Consolidated, Big Oak Flat, in charge of F. H. Parkinson, is running the 10-stamp mill one shift and crushing rock from the 450 and 500 levels, and is also milling an old dump with good results.

Sonora, Dec. 10.

The Carters New Era says the Lady Washington tunnel is now in 180 feet and driving at the rate of 25 feet a week. The prospect shaft at the Top Notch mine, back of Old Town, is down 75 feet. Quartz has been struck bearing free gold. The Draper is using hand drills, being unable to get fuel oil. The Black Oak closed down one day last week on account of failure of power.

C. Cummings has finished his contract at the Sullivan mine near Soulsbyville. It is said that a new record was made for the county in sinking, 100 feet having been sunk in fifty-five days. The shaft is down 188 feet.

The Albatross M. Co. has bought the Jersey Blue and Vulcan claims near Carters. The Jersey adjoins the south extension of the Goldwin.

The cyanide plant at the Rawhide mine, near Jamestown, has been attached to satisfy claims against the owners. The plant was built to work the tailings and is not the property of the App Con. Co.

The 10-stamp mill on Mt. Hood, near Jamestown, has resumed. J. H. Burkhart is superintendent.

The cleanup at the Fairview at Minersville from the first run was \$5000. The company bought the mine last spring for \$60,000; since have expended \$40,000 in improvement. A ledge of free-milling rock has been opened.

Superintendent O'Brien of the Big Casino M. Co., near Big Oak Flat, has fifty men at work. On the Mack claim, the boilers and hoist are in place.

Supt. J. N. Judson has opened up the pay shoot on the Vine Spring mine, near Columbia, which is under bond to Santa Ana men.

Estee & Co., at their gravel mine on the Doyle property, near Columbia, are drifting to find the width of the pay streak.

W. Grant has men at work exploring a marble quarry on the Vine Spring ranch. Two bids for running drifts have been let by the Jumper Gold Syndicate at \$200, 500 feet each in the Jumper and Golden Rule.

The Republican mill, near Jacksonville, is in operation.

The Phoenix Lake power plant was shut down last week and as a result mines relying on electric and water power were obliged to suspend entirely or reduce the force. The rains thus far this season have been heavy and the snowfall in the mountains deep; the cold weather has frozen the snow and the volume of water from the Sierras is small. A body of ore carrying free gold and a quantity of rich sulphurets has been struck in the Vine Spring mine, near Columbia.

Owners of the Over mine at Saw Mill Flat, near Columbia, are prospecting on a parallel vein. In the Over connections have been made by upraise from the tunnel level with old surface workings. Some gold was found while this upraise was being put through. A shaft will be started on the vein in the tunnel 1100 feet from the surface.

The Woodbury placer claim, on Yankee Hill, near Columbia, will be operated again as soon as water is available. The Dondero claim, near it, is in readiness for another run when the water comes.

The Golden Era, formerly the Page mine, is being equipped by Conlin & Pownall, the owners. A compressor, new hoist and concentrator is being put in, and a telephone line run from the mine and connected with the water company's line. The mine is near Italian Bar. The 55-foot winze in the 175-foot tunnel will be sunk 150 feet deeper. The ore carries

high-grade sulphurets. A crushing plant of five stamps is now on the mine.

The \$50,000 cyanide plant at the Confidence mine is nearly completed and will be in full operation by the first of January.

Gravel struck in the Ranch mine on the Doyle place, near Columbia, in an old river channel, is reported to prospect 25 cents to the pan on bedrock.

W. H. McClintock will incorporate a mining company to operate the Payday and Stokes mine near Don Pedro. The company will be named the Don Pedro Gold Mines.

Operations are to be resumed on the Lampher mine at Confidence, north of the Confidence mine, on the same vein.

At the Mt. Jefferson mine at Groveland, Foreman J. H. Gilmore is opening up the ore bodies on the third and fourth levels. The pump has been sunk 25 feet and an ore bin put in at the 400. The mill has resumed.

YUBA COUNTY

The Brown's Valley mines, including the Pennsylvania, have been sold by F. W. Johnson and T. J. Hibbert to the Standard Con. M. Co., of San Francisco, who will develop the properties.

COLORADO

BOULDER COUNTY

J. H. Ransom, owning the Fissure mine, near Boulder, reports having cut into ore assaying 5 ounces gold and 1½ ounces silver.

The Boulder County Oil & Refinery Co. at Boulder is operating. Samples of water-white kerosene, gasoline and benzene are being exhibited. The by-products vaseline, paraffin and lubricating oil have not yet been treated. The casing of the Citizens well has been pulled and will be taken to a well to be drilled ½ mile north of the two Otero wells.

The directors Wellington G. M. & M. Co., P. M. Housel, A. Johnson, C. A. Wolcott, W. W. Degge, propose a pyritic smelter for their property on Gold hill, near Boulder.

The Times says it is proposed to open up the Caribou district by a tunnel to be run from Eldora 2 miles long and will give that district a depth of 1000 to 1500 feet, and will also afford drainage for mines in the district.

The Enterprise mine, Spencer mountain, will be worked by the leasers, Phillips & Shahan.

The Revenge tunnel, being driven into Bryan mountain by the Revenge D. Co., is in 75 feet and has cut a telluride vein. This tunnel will cut thirty properties.

The Fourth of July tunnel, at the base of Arapahoe peak, is now in 300 feet, with two air drills at work.

The leasers on the Revenge, Nelson and Harpel made another shipment this week. The Senator Tillman, El Dorado mountain, has closed down for the winter.

The machinery has been placed on the property of the Tungsten M. & M. Co. at Jenny creek and work will begin on the Walter A. shaft.

The Jasper Oil Co., near Boulder, has resumed drilling with its first well down 1300 feet and expects to reach the oil this week. It is intended to start the Blue Jacket, which is owned by the same company.

Total shipments of oil from the wells since their discovery is fifty-five carloads, 6891 barrels. The value of the oil produced and delivered by rail to the present time, at \$1 per barrel, is about \$7000. It is estimated that \$1,000,000 was expended in the northern oil belt.

CHAFFEE COUNTY

The Vivandiere shaft of the Twin City M. Co., near Turret, is down 565 feet and will be sunk to 1000.

The Crete, near Turret, has a 10-inch vein assaying \$80 in gold.

The Independence, at Turret, is shipping several cars of high-grade ore.

J. Powers is developing a claim in Longfellow gulch.

The Josephine, at Turret, owned by B. V. Ritter, shows a 4-foot vein of rusty quartz and sulphides running in gold.

A. Smith & Co., who located a group of claims on Bear creek, have started a tunnel to cut several large veins at 600 feet. They are in 100 feet.

The Record says G. M. Webster has located a 4-foot vein of gold ore near Salda, in the Sangre de Cristo mountains, that assays \$25.

Owing to a scarcity of coke, Manager B. F. Morley of the Buena Vista smelter has banked his fires for a few days. The smelter is treating the siliceous ore from the Mary Murphy mine at St. Elmo, which is leased by the smelter. The iron flux is obtained from the Mike & Starr at Leadville, also leased by the company. The smelter has twenty-five men at work.

CLEAR CREEK COUNTY

The extension of the railroad from Silver Plume to the Terrible mine is in operation. Superintendent G. F. Crawford says he

has added to the number of men at work in the second adit of the Kinda mine. The paystreak is 3 feet wide and runs 20 ounces silver and 2 ounces gold to the ton. The balance of the rock runs \$20 and all of the product will be sent to the smelters. An adit below the second level will be driven from Fall river to cut under this ore body.

Biggar & Co., who for years have been leasing on the Lake tunnel, have a five years' lease on the Windsor Castle, and the main shaft sunk.

Near Georgetown the Kelly tunnel is in 1720 feet and 300 feet in the drift, having been driven 300 feet in November. Three machine drills are run in the tunnel and one in the drift. The tunnel is expected to cut the Boston lode about the first of February. At the Capital Co.'s mine Manager W. Cooper has made 3000 feet of development work and is crosscutting. The shaft is down 200 feet. The company will install a compressor plant. At the Terrible mine, near Georgetown, masons are laying the foundation for the mill and compressor.

The Star tunnel, near Idaho Springs, has passed through a large porphyry dike, which caused much trouble. After a round of holes had been fired, it took two days of tramping to get to the breast, the porphyry having caved. The tunnel is again in granite and will soon reach the Columbia vein.

E. W. Williams of the Specie Payment, near Idaho Springs, says that the Champion and Donaldson mines have already been turned over to his company and men are working on the Donaldson. The Donaldson mill is in the courts on account of a tax title, but will be rebuilt.

Development work is in progress on the Waldorf property, near Georgetown, consisting of the Tobin, Paymaster and Commonwealth claims. The miners drifting on the Wheeling vein in the Tobin have passed the cross lode and ore is beginning to appear again in the breast. A drift on the cross lode will be run 80 feet to the Independence vein and stoping will be continued in two places on the Wheeling lode. The drift on the cross vein from Wheeling will cut the ore body 350 feet deeper than in the Independence, 700 feet below the surface.

Assays made on ore from the west drift in the Gomez mine, near Idaho Springs, says the Gazette, show an 18-inch streak of copper-iron sulphide on the foot wall to carry an average value of \$36.34 in gold and silver. A body of ore is reported in the Harper tunnel. E. Alexander has a contract to drive the tunnel on the Hilton properties and is making 10 feet per day.

Owen & Morgan are putting in a double cylinder engine and an 80 H. P. boiler at the Morning Star. Manager C. E. Stubbs at the Perkins has let a contract to drive the tunnel another 200 feet, in which distance he expects to cut the Stanley vein. The contract will give the tunnel a length of 1700 feet.

Operations on the Pittsburg Co. are being pushed. Shafts will be sunk on both the Dover and Brighton mines. The Dover shaft is down 240 feet.

Superintendent W. T. Darby of the Empire mine, near Idaho Springs, reports making 5 feet per day in the tunnel being driven into Covode Mt.

The Sultelma Tunnel Co. has bought a group of claims in the Cascade district—the Hecla, Calumet, Sultelma, Paymaster No. 1 and Bachelor No. 1—and will drive a tunnel to cut these claims. The company has incorporated; A. A. Pierce, D. A. Clark and F. B. Angell.

Smith & Stokes have an option on the Kongsberg claim, near Georgetown, and are using the Kongsberg tunnel in the development of the Venus. They have extended the tunnel 275 feet into the Venus, where they cut a 6-foot vein.

Bristol and partners are developing the Badger and other claims of the Gold Fissure Co., near Empire.

Superintendent C. Jarbeau has thirty men at work on the Gold Dirt, near Empire. The output of smelting ore is 150 tons per month, average \$45. The mill dirt is being stored pending the erection of a cyanide mill.

On the No. 6 level a body of smelting ore has been opened up. A three-compartment upraise is being driven from No. 6 to connect with No. 3.

DOLORES COUNTY

The News says the Con. Rico M. Co. at Rico, owners of Iron Mine-Exchequer lead through Telescope mountain, intend to put in a pyritic smelter.

Superintendent R. Keller is adding an 80 H. P. boiler to the steam plant at the Emma mill at Dunton.

EL PASO COUNTY

Operations on the oil well of the El Paso G. & O. Co., on the Pope ranch, near Pipeview, are resumed. The well is down 1700 feet.

FREMONT COUNTY

Three hundred wells have been drilled

in the Florence oil field in the last seventeen years by the United Oil Co. Each well drilled costs from \$3500 to \$5500 and the average depth is 2200 feet.

GILPIN COUNTY

The Post reports from Central City sinking at the Grace Darling shaft of the Electric Spark G. M. Co., in Lower Lake district, now down 200 feet. They are installing machinery and putting up a shaft building.

E. M. Messiter of Central City is sinking the shaft on the Sampson claim, in Leslie gulch, near South Boulder creek. Ore has been opened up and assays show ½ ounce gold, 240 ounces silver and 20% copper. Some silver glance has been found.

The Buckhorn extension and Snowden group of eight claims, at the head of Silver creek, in the Silver, Lake and Hawk-eye districts, near Central City, are reported sold. The property will be operated through tunnels this winter and the product shipped to Black Hawk as long as the roads remain open for hauling. In the spring they intend to erect shaft buildings and install machinery on the Buckhorn. W. H. George of Central City is manager.

Cripple Creek and Denver parties have a lease and bond on the Stright tunnel, near Boulder park, and work will be carried on all winter. The tunnel is in 200 feet.

The Central City Call says the Moffat or Northwestern, Denver & Salt Lake Railroad will run along South Boulder creek, up Boulder park and through the main range west of James peak. The tunnel through the main range will be 2 miles long. A temporary road will be built over the range which will pass along Jenny creek. Work is to be started on the road next month.

The Central City Call says the Mountain Monarch M. Co. has reorganized and the capital stock increased, with the following new officers: R. M. Hicks, F. Rinckle, F. Augustus, W. Augustus. There is a crosscut in 200 feet and a drift on the Chieftain vein 150 feet. A winze has been sunk on this vein, but they were stopped by water. They have shipped ore to the Peterson mill at Gilpin and to the Golden smelter, but expect to build their own plant. O. L. Duffield of Rollinsville is manager.

Central City says the Victoria is being worked by Stephens & Co. and its output is being treated at the Peterson mill in Gilpin.

Babcock & Co. have cleaned up their Beaver Creek placer after a successful season. Some placer mining has been carried on in Gamble, Lump and Moon gulches and on Jenny and South Boulder creeks.

Manager J. E. Lightburn has seventy-five men at work at the Perigo mines and has the 30 stamp mill in Gamble gulch running.

Superintendent A. M. Willard of the Travis Gulch M. & D. Co. is sinking on the Garfield shaft in Travis gulch, near Central City.

The Call says up Jenny creek operations will be carried on all winter on the Walter A. property where wolframite ore has been found.

Omaha, Neb., men are interested in the Franklin property in Moon gulch, near Central City, and a crosscut tunnel has been started to cut the veins with depth.

Leasers are working in the Gold Collar mine, Eureka gulch, at a depth of 300 feet, and taking out milling and smelting ores.

Central City reports Superintendent W. H. Richards has resumed operations at the King property in Nevada district on the 80-foot level, and will begin stoping. The Nevada Con. M. Co. is working the 200 level of the Lamberson & Warren mine and are shipping ore. The ores carry lead values and are handled at the mills and sampling works. Bartle & Co. of Nevada, leasing the English-Kansas mine on Quartz hill, are making shipments to the mills. Their last lot of smelting ore carried four ounces gold per ton. They are working the property on a lease from the Kansas-Burroughs Co.

A company has been formed to operate the Foote & Simmons mine on Bobtail hill, near Central City, and machinery will be installed and the shaft sunk 400 feet to the 1000-foot level.

GUNNISON COUNTY

Manager W. R. Callicotte, the Sunrise M. Co., near Pitkin, has the tunnel in 400 feet siliceous ore lying between walls of porphyry and granite. The Sunrise group has fourteen claims in Tellurium gulch at the foot of Treasury mountain. A. E. Moyn is working the Maid of Orleans group, which lies across Quartz creek from the Mineral Farm basin.

The Revenue group of claims in the Box Canyon district, between Ohio City and Wauanita, is reported sold to New York men for \$50,000. The vein showing

in the bottom of the shaft is 7 feet wide and assays \$15 in gold. As soon as a road is built shipments will begin. E. K. Buttolph of Denver is manager.

LAKE COUNTY.

(Special Correspondence).—The Last Chance M., M. & T. Co., Denver, Colo., owning 70 acres of lode claims and 20 acres of placer ground on the south side of Bull hill, 10 miles west of Leadville, are driving a tunnel. In 90 feet the tunnel is 1000 feet below timber line, and will cut the veins at a depth from 100 to 2000 feet. Ore assays from \$10 to \$65 per ton; will erect a mill later on.

Leadville, Dec. 10.

The Times reports that the drop in silver has not closed any properties at Leadville, but, should it continue, its had effects will be felt, as there are a number now operating that barely pay on 50-cent silver and have only been able to mine at that price recently through more economical banding of their ores. While a still further drop will not stop all mining there—as Leadville has other metals—it would for a time materially affect the industry. Outside of this question and its effect on the mines of Leadville, mining conditions are good, as a large amount of new work is under way and more is planned.

On North Star mountain the Ling, the Lee Gers, Viking, Montgomery and other properties are installing milling and concentrating machinery. The Ling is shipping by pack train to Alma.

At Leadville the Valentine M. Co. has resumed.

A company has been formed to explore the territory in East Tennessee park. The company has a number of claims near the Helen Gould group, and drill holes have shown good geological conditions.

The Resurrection mill is nearly completed. It will treat 150 tons per day of low-grade sulphide, using electric separation to obtain high-grade zinc. The Resurrection ore also contains a small amount of gold, which will be saved with the iron, lead and copper.

The cyanide mill in course of erection at the Ballard mine will treat a class of ore heretofore not successfully handled. It is low-grade siliceous material that by smelting costs \$4 to \$5 to treat. Experiments made on this ore have been thorough, and it is known that the material can be treated by cyanide.

The Bohn property is leased by E. L. Daniels and others and iron is being shipped from the main workings.

The Leadville Dispatch says the Empire Gulch M. Co. are shut down while a pumping plant is being put in. Recently they entered the contact and struck a heavier flow of water than they could handle.

Ore shipments from Leadville district for November reached 75,000 tons; December is expected to show a further increase, because of new producers. A large percentage of these shipments are low-grade material. The Vinnie and the Golden Eagle properties were cut at a depth of 1300 feet by the Yak tunnel, showing the lode at that level.

Manager C. E. Dewey says he will resume operations at the Cloud City mine, near Leadville, and expects to contract with the Colorado Fuel & Iron Co. for manganese. A year ago the company while exploring in an upraise from the 500-foot level cut through 40 feet of manganese ore. About 150 tons were shipped to the Illinois Steel Works. There is a spur of the Colorado & Southern at the mine so that transportation charges will be lessened.

The surveyors have completed their work on the Daisy & Laura placer on the ridge west of Leadville.

The Arkansas Valley smelter at Leadville has made a contract for a large quantity of fireclay from Big Evans gulch for making brick and lining.

T. S. Schlessinger at Leadville is shipping iron ore from the Bon Air and P. O. S. To put a new plant on the Bon Air, repair the shaft, cut two new stations and make other changes cost \$20,000. A plant has been installed at the Starr and mining resumed. The pumps at the Bon Air keep the Starr dry to the 550 level.

The Johnny mine is connecting its lower levels with the Yak tunnel extension. The Rex shaft, operated by the Keystone Co., is nearing the contact. Manager T. Kyle of the Boulder M. Co. is prospecting low-grade ground from the new shaft.

The Last Chance, near the Dyatt properties, is being worked by T. S. Schlessinger of Leadville. The mill is being re-modeled and new concentrators put in. The mill will handle the Peerless and Last Chance ore.

The Two Bit M. Co. at Leadville has shipped a lot of ore assaying 16.07 ounces gold, 48 ounces silver and 15% copper. This comes from the vein recently cut in the shaft. D. McNiven is superintendent.

H. Dyatt, operating the Peerless and Peerless Maude properties in the Horse-shoe district has opened a body of silver

and lead ore in the lime and it is similar to that in the Continental Chief on the low gulch side of the range. In the Peerless it is 4 feet wide. On the Peerless Maude the shaft is down 180 feet. Much of this ore is of shipping grade, averaging \$30 per ton. Six men are at work.

No Leadville property has as yet been compelled to close on account of the fall in silver. The smelters' cut has helped the situation.

The Salida plant is taking a large amount of iron ore from Leadville. The Catalpa-Crescent leases are shipping thirty to forty tons of iron daily, and considerable low-grade silver ore from the Dinero dump is moving. The New Monarch ships 150 to 200 tons daily and has a great amount of oxidized ore on hand.

The new workings in the Bangkok-Cora Belle shows mineral that will carry fifty ounces silver, and Manager Newell will begin to ship.

LA PLATA COUNTY.

The Miner says the Happy Five Co. have six men at work on the Small Hopes and are taking out ore.

N. H. Harbaugh is operating properties at the head of Tiburcio gulch.

The Neglected Co. will put up a mill on Junction creek, near the mouth of Wall's gulch.

The Durango Girl shipped several tons of ore to Durango last week.

LAS ANIMAS COUNTY.

The C & S. R. R. Co. has struck oil in one of its wells at Barela, near Trinidad. The People's Oil Co. received two carloads of casing last week and have resumed drilling.

PUEBLO COUNTY.

A 9-foot vein of coal is reported struck on the Tabor-Skinner ranch, near Pueblo, at a depth of 450 feet, while an oil well was being drilled. D. H. Moffat and G. E. Ross-Lewin of Denver are directors of the company.

SAGUACHE COUNTY.

The Crestone Star M. & D. Co. is incorporated by Missouri men; A. Hughes, G. W. Schweich, J. W. Kinzel. The company owns three claims and a mill site on Terrible hill, near Crestone and adjoining the Cleveland. Three veins cross the property, and 500 feet of work has been performed to determine their location and dip. A tunnel is being driven to be 10 feet in length. This property is located on the Hayden dyke, which runs north and south along the range of mountains. There is sufficient timber on the ground for use in the mine.

SAN JUAN COUNTY.

Superintendent Martin says the Tom Moore tunnel, near Silverton, is in 1700 feet, with indications of approaching the shoot for which it is being run.

Silverton Standard says the Charter Oak mine is to be opened by a 500-foot tunnel.

Superintendent W. R. Pyke of the Royal M. Co., near Silverton, says the Royal tunnel on Sultan mountain cut the King vein at 1040 feet, 900 feet from the surface. Drifts to the south will be run and the tunnel run 200 feet to the Mazeppa vein.

SAN MIGUEL COUNTY.

Lessees operating on the land of the Butterfly-Terrible Co. at Ophir have sent to the officers of the company a gold bar valued at \$1100, the result of the last run. The company is doing development work. There are sixteen men at work.

SUMMIT COUNTY.

The Cashier, near Breckenridge, has fifty men at work. The 20-stamp mill is being added to, which will make the capacity 200 tons per day.

The dredger on the Swan placer, owned by the American Dredge Co., of Boston, which has closed down for the season, averaged 1700 cubic yards every twenty-four hours, two shifts of twelve hours each—47 feet to bedrock. The company will declare a dividend and build one or two dredges next summer, costing \$75,000 each. This company also operates the Gold Run placer, sluicing with giants. In working up hill they lost water pressure. Next spring a force pump will be used to wash the ground.

The Hamilton mine, in Summit gulch, has resumed after three years' idleness. A company has taken a bond on the property and raised from the lower level, so that the ore may be trammed into the mill.

TELLER COUNTY.

In the Canadian King 2 feet of five-ounce ore has been found. Some time ago the values disappeared. In prospecting along the wall a few shots blew out a slab of rock disclosing the vein giving assays of five ounces in gold to the ton.

The lessees on the War Eagle at Windy Point have run a crosscut in ore a distance of 30 feet and no walls visible. As the ore is broken it is running \$40 a ton. A half interest in this property is held by Strat-

ton's Cripple Creek M. & Dev. Co. and the other half owned by S. J. Kelhey.

O. B. Finn & Co., leasing the Magna Charta on Ironclad hill, have begun work on foundations for a small cyanide mill. The mineral averages \$10 a ton.

The output of the Last Dollar mine for November, officially reported by Superintendent Waldron, amounted to sixty-four cars.

The Valley City Leasing Co., Cripple Creek, operating the Shurtloff on Bull hill, are shipping three cars of ore per week from the seventh and eighth levels averaging four ounces in gold per ton. The shaft is being sunk from the 800 to the 900 level. Manager M. Bowers says during November he shipped 400 tons of four-ounce ore.

At Cripple Creek lessee F. D. Jacquette, operating on the Rising Sun claim, is shipping three carloads per week, value \$30. He is working on the Pinto vein. Barr and associates have made a cleanup on their lease on the Pinto claim and shipped out fifty-five tons which went 2.25 ounces gold. They have been working through the shaft, which is down 550 feet. Sweatman & Co., working on the Pueblo claim, have a shaft down 125 feet.

Members of the water committee say it is proposed to run a drainage tunnel 10,000 feet long to tap the mines of Cripple Creek at a depth of 3000 feet. Another tunnel known as the El Paso will be run, the Mary McKinley, Elkton and El Paso guaranteeing \$100,000.

The 4-foot vein in the Dillon at Cripple Creek is producing a car of ore a day, averaging \$50 a ton. Two cars of \$30 ore are shipped each week from the 500-foot level of the Coriolanus. The Par Value G. M. Co., which leased these properties, intends to ship its ore from the Coriolanus through the United Mines tunnel to the Economic mill instead of shipping out of the district. The Mary Cashen, also leased by the Par Value, is shipping two cars per week from the third and fourth levels.

The Bonanza King No. 1 on Tenderfoot hill, Cripple Creek, is shipping ore.

Lessees on the north end of the Pharmacist have opened the north extension of vein No. 2 of the Empire State, near Cripple Creek.

The Lettie H. G. M. Co. has incorporated to operate claims near Woodland Park; J. C. Griffiths, J. C. Carroll, G. E. Powell, I. F. Frye. Operations are carried on through a tunnel, but it is intended to sink a shaft. The formation is felsite, porphyry and metamorphosed granite and jasper.

A strike of smelting ore has been made by lessees in a drift on the 600-foot level of the Kittle M., owned by the Anaconda Co. at Cripple Creek.

C. Wilder, leasing on the Arapahoe claim of the J. Johnson Co., Cripple Creek, is shipping ore from the 300-foot level. Wilhelm & Co., leasing on the Wilson claim of the Free Coinage Co., is shipping ore from the 275-foot level. The pay shoot is 8 inches wide, \$250 rock.

Milwaukee men have a bond and lease on the Poorman Extension claim of the Le Clair Co., Cripple Creek. Manager B. Gilbert is putting up a hoiler and hoist and will sink to 300 feet.

War Eagle Leasing Co., operating on the War Eagle property, near Cripple Creek, will increase their output by sixty tons of ore daily.

Lessee Whalen, working the Happy Year claim of the Central Con. Co., has two cars of ore now ready to ship.

Lessee C. Martin at the Little May on Beacon hill, Cripple Creek, has found the vein 300 feet east of the shaft. He found the vein in an open cut on the hillside. Martin and associates have a two-years' lease.

The Ajax, near Cripple Creek, has resumed after a week's shut down to repair the compressor.

R. Snyder, leasing on the Agnes, near Cripple Creek, is shipping ore from the 100-foot level. The value is in a gouge vein running \$100 per ton.

Work has resumed at the Little Nell, near Cripple Creek, and returns from the first carload shipped gave returns of \$45 gold.

N. Wilson, leasing on the Half Moon of the Matoa Co. on Gold hill, Cripple Creek, shipped two cars of \$30 ore last week from the sixth level. Bad air has interfered with his work.

The Mary Mack claim, near Goldfield, adjoining the property of the Homestake Co., is reported leased. It is intended to sink the shaft to 100 feet and then run drifts.

Lessees on the Isabella dump at Cripple Creek are shipping a carload a week. The five smokestacks of the Isabella G. M. Co. were blown down by the gale which struck the camp last week. It was found that the sulphur fumes had corroded the iron around the base of the stacks.

Woods brothers, near Victor, claim to have discovered an extension of the Wild

Horse in the Damon on Ironclad hill. In a bottom level of the Damon they drifted south and west to a body of low-grade mineral, having the same character as the Bull hill streak.

Lessee Gilmore on the Work, on the west side of Raven hill, near Anaconda, says at a depth of 100 feet a drift cut 2 feet of gangue. The mineral was oxidized and partly talc. Assays on washing show a value of \$90 in gold and tailings \$40.

Victor says T. Mulvahill has leased a portion of Deadwood No. 2. The output from the Golden Cycle during November was 3500 tons, of which 500 tons was shipped by lessees. The values averaged \$25. November shipments from the Hull City placer of the Independence Con. Co. by Cripple Creek M. Co., lessee, were 1800 tons, average value \$40.

Lessee Darnell, who opened up the ore body on the War Eagle of Stratton's Cripple Creek M. & Dev. Co., has opened up the same shoot on the Unexpected claim of the Central Con. Co. where he has a lease. Portions of the Amanda and Kate Hollis claims are between the Unexpected and the other property of the Central Con. Co., but that company has right of way through that ground.

Hanson and others, operating the lease on the Maud Helena of the Pilgrim Co. on Bull hill, Cripple Creek, are crosscutting to the west at a depth of 125 feet to find the Delmonico vein.

During November the Last Dollar, near Cripple Creek, produced sixty-four cars, twenty-four going to the mills and forty to the smelters. This is an increase over the production of the previous month. The tunnel is now in 2800 feet.

Lessee Wallace on the Beacon of the Prince Albert Co., near Cripple Creek, has struck 3 feet of ore below the 185-foot level.

The contractors sinking the C. O. D. shaft, up Poverty gulch, near Cripple Creek, for 200 feet, are pushing the work. When completed, they will be down 930 feet.

The Lincoln M. & M. Co. will resume development on its property near Gillett.

C. Tillery, operating a block of El Paso property through the Old Gold tunnel, has opened an extension of the C. K. & N. vein.

Manager Rice of Stratton's Cripple Creek M. & D. Co. has closed the assay office at the Summit and the work is now being done by private assay offices. The reason given was that the expense was greater than the price for which the work could be let out.

The directors of the C. K. & N. G. M. Co., Cripple Creek, have declared a dividend of 1 cent a share, payable December 18. The company is not operating on its own account, but leases to H. Granfield. The property consists of one claim, the Raaler. Granfield has yet two years on his lease. Connection is being made with the workings of the El Paso Co., which adjoins, and pumping arrangements effected; ore is being broken on the 300-foot level. The shaft is being sunk. The El Paso Co. has the C. K. & N. vein at the 600 level.

The Storm King M. Co., Cripple Creek, have leased their property adjoining the Victor mine, on the east slope of Bull hill, to J. W. Palmer and J. G. Owens of Denver.

Lessee S. Vidler has opened the vein on the Ironmaster claim of the Jack Pot Co., near Cripple Creek.

Manager Gilbert, working on the Poor Man extension claim of the Le Clair Co., is building a gallows-frame and will sink the shaft to 300 feet.

Franklin, Sift & Co. of Colorado Springs have taken up the option of the Morrill lease of the Grace Greenwood property of the Anaconda Co., near Cripple Creek. The price was \$5000.

IDAHO.

ADA COUNTY.

The World says that one prospector in the Black Hornet district, near Boise, has located forty claims within an area 5 miles east and west by 3 miles north and south.

BLAINE COUNTY.

The miners at the Liberal, near Hailey, have been laid off, pending the placing of an air compressor.

IDAHO COUNTY.

C. W. Luck of Weiser says of the Big creek district in the Thunder mountain section that across the head of this creek and its upper tributaries is a series of fissure veins that can be traced for miles in an east-west direction. They run through the Archæan and Palæozoic formations, and are often filled with quartz which generally carries much iron. Dikes of porphyry and diorite also are found. Although some fine milling and high-grade ore is reported, the ore in these veins is generally low grade and base. The ledges are extensive and may prove profitable if transportation facilities and a cheap

method of treatment can be had. The development work going on on Logan and Smith creeks and the opening up of the discoveries on Quartz and Profile creeks will prove the deposits in this zone. Water power and wood are abundant.

The St. John and Belcher mining properties at Elk City are bonded to Spokane, Wash., men. The claims adjoin the Laurel Hill mine and have a ledge 8 feet between the walls, assaying \$20 in gold. Winter quarters have been erected for the men and the work is being pushed.

SHOSHONE COUNTY.

Near Delta lumber is being hauled for a fourth dredger on Beaver creek, to be built on the Louis Nistler claim. Carpenters are building dredger No. 3. The pit is dug at the mouth of Trall creek, on the Coulson & Heustlis claim.

Busen & Brooks are drifting on their placer ground on Trall creek and taking out coarser gold than before. They are at the mouth of Potosi creek and find bedrock at 21 feet.

R. D. Bohannon is drifting for the bedrock on the Houie hydraulic property in Pony gulch.

C. S. Chrysler, manager of the dredger companies near Delta, has taken up the bond on the F. C. Gordon properties, 170 acres, including the sawmill, water right, residence, etc.

Manager J. Keene of the California Con. M. Co., near Wallace, expects to add the Monarch property to their holdings.

Manager J. W. Webb of the Burke M. Co., near Burke, is pushing work on the buildings at the Buckeye property, a group of six claims adjoining the Ajax and Oom Paul.

Work at the California Con. mine on Nine Mile creek, near Wallace, has been suspended for the winter. The main lead of the California has been worked to the line of the Mammoth property, which it adjoins on the west.

C. M. Chrysler, president of the dredger companies at Delta, has sold six placer claims to the Beaver Creek G. M. Co. for \$5500. The claims are located on Beaver creek and adjoin the claims being worked by dredgers. The claims comprise 140 acres.

MICHIGAN.

HOUGHTON COUNTY.

The Mohawk mill at Houghton is in operation. The new mills of the Wolverine and Mohawk are more nearly automatic than any others in the district. The rock goes in at one end and the mineral reaches the packing bin at the other end, without having been touched by hand. The two heads require nine men on the floor.

The Tecumseh mine, near Houghton, has closed down, owing to the bumpy character of the rock. The shaft is down 2270 feet. The Champion mill is in operation.

MONTANA.

BROADWATER COUNTY.

A new tunnel is being driven on the H. & H. mines, near Winstan.

The Powell Co. at Elliston reports that the Boston & Seattle M. Co. propose a reduction plant and will treat ores mined between that place and Basin.

Manager W. L. Higgins says the vein of the Emery mine, near Deer Lodge, has been struck from the shaft below at 1050 feet from the original working shaft on the incline.

DEER LODGE COUNTY.

The Ophir mine, at Anaconda, is unwatered. The Travona mine is being unwatered with a 500-gallon haling tank.

FLATHEAD COUNTY.

(Special Correspondence).—A strike has recently been made in the Brick & Brannigan mine. The main tunnel has entered a body of ore 16 feet wide.

The find made near Iron Meadow last September is being developed. Supplies to last six months have been taken in.

Mining in West Fisher and Libby Creek districts is being stimulated by the report of the building of an electric car line.

It is reported that the Way Up Co., near Cabinet, are planning for a mill next season. The mine is situated 1 mile from the Mother Lode mine on West Fisher creek.

H. Hildebrandt reports work progressing on the Alabama group.

The Mustang Co. has ore which assays \$100 in gold per ton. This property is approaching the producing stage.

At the American Kootenai Co.'s property the Gardner electric drills are used. Fifteen men are employed on development work. Several shoots of ore have been found the past two months.

The development of the Bachelor group by the Michigan Co. continues with eight men. This company will build a mill below the American Kootenai mill and get water from West Fisher creek.

The placer mines on upper Libby creek

have closed for the winter. They have been steady producers for the last fifteen years. Last spring two hydraulic plants were erected to work gravel from the higher bars.

Cabinet, Dec. 1.

JEFFERSON COUNTY.

J. P. Ormond and E. Chapman of Anaconda have taken a lease and bond of the Belle of Basin mine, near Basin. The Hiawatha mine, near Basin, is under lease and bond to Dowling & Madden. The property has a shaft down 500 feet and a 400-foot tunnel.

LEWIS AND CLARKE COUNTY.

The Boston & Seattle Co. have twenty men at work on the Ontario-Richmond group, on the main range southwest of Helena. The tunnel on the Ontario is in 20 feet and is 120 feet below the crosscut tunnel.

Ore is being taken out from the upper workings of the Kruger copper mines, at Copper Camp and teamed to Silver for shipment.

The Teepie M. Co. has incorporated, under the laws of South Dakota, to work claims in the York district, near Helena. The property has been prospected for 2700 feet on the surface by tunnels and shafts, one tunnel 320 feet and one 165 feet. The ore averages 18% copper, 60 ounces in silver, and \$18 in gold. A tunnel 600 feet long will be driven to crosscut the vein at a depth of 420 feet. R. E. Teepie is president and manager.

F. W. Fosberg, manager the Corbin concentrator, near Helena, will put up a 50-ton concentrator at the East Pacific mine in the Winston district. There are 17,000 tons of ore on the dumps at the East Pacific mine.

MISSOULA COUNTY.

It is reported at Wallace, Idaho, that a smelter is to be built at Saltsee, Mont., the St. Regis section of the Cœur d'Alenes.

H. Welsh, coal mine inspector for Montana; S. S. Secor, a banker of Winnebago, Minn., and Minneapolis capitalists bonded the Monitor and development has begun. Shortly afterwards Mr. Welsh and his associates bonded the Richmond. Development showed that the vein crossed both properties for more than 1000 feet. A smelter site and water rights were secured. There is water power to operate the smelter and an electric tram from the mine to reduction works, a distance of 6 miles. It is said that the electric plant is to be installed early in the spring, and work on the smelter to be begun later. A number of developed properties in that section are ready to ship ore.

PARK COUNTY.

A natural gas well has been discovered in the coal measures, 2 miles west of Livingston.

The 10-stamp mill of the Gladstone M. Co., near Pioneer, will be in operation next week.

SILVER BOW COUNTY.

The Standard reports the reef near Brown's gulch, 7 miles northwest of Butte, has been bonded to Finch & Campbell of Spokane for \$100,000. It will be cyanided.

NEVADA.

EUREKA COUNTY.

W. Laird has leased from the Richmond M. Co. the old and new Williamsburg mines on Adams hill, adjoining the Bullwhacker mine. The lease is from December 1, 1902, and runs for two years. R. A. Laird and G. Young Jr. are interested and they are preparing to begin work. The Williamsburg produced the richest silver-lead ore ever taken from Adams hill.

HUMBOLDT COUNTY.

The final payment on the Sheba group of mines at Star City has been made by the Sheba G. & S. M. Co. of Salt Lake City, Utah. The company holds twenty-seven locations, together with a mill of fifty tons daily capacity. The lower tunnel is in 240 feet, with the first ledge to be tapped in the next 60 feet, while the main Sheba ledge is 400 feet distant. J. T. Kessel is superintendent.

The Foltz placer mine at Spring Valley has been sold to Chicago capitalists for \$40,000. The placers have produced \$3,000,000.

NYE COUNTY.

The Record says "Hanapah," the name of a mining proposition recently located 18 miles east of Tonopah, is a Japanese word meaning "hang on tight." Superintendent F. B. Work reports at a depth of 70 feet in the new shaft of the Hanapah a foot of ore on the foot wall which assays 175 ounces silver and \$30 gold.

The Miner says R. T. Brodeck of Bakersfield, Cal., has bought the Morning Star and Georgia Taylor mining claims on the south side of Gold mountain, near Butler. Machinery will be installed. On the Stone Cabin drifts are being run on

the vein at the 200 level and a crosscut driven south on the same level. The shaft is being sunk at the rate of 4 feet a day, with three eight-hour shifts, and is down 245 feet. An engine and crusher are being installed.

The Miner says at the Fraction, near Butler, the west drift from the 400 level of shaft No. 1 is in 300 feet and the face in milling ore. Ore is being hoisted from the 300 level of shaft No. 2. The shaft of the Mizpah Extension is down 550 feet and the crosscut from the 500 foot level is in 345 feet.

At the New York-Tonopah the shaft is down 460 feet, the formation showing quartz and calcite seams. The Montana-Tonopah shaft is down 355 feet; stringers of quartz and mineralized porphyry are found. Crosscutting will be begun at the 400 station. At the Ohio-Tonopah the shaft is down 360 feet; was sunk 130 feet during November.

The Tonopah Fraction Extension M. Co., S. A. Knap, superintendent, are down 35 feet in its new shaft on the Outing claim. A steam hoist is on the road from Candelaria. Sinking will be continued to the 500 level.

The annual report of the Tonopah M. Co. states that the past year 7000 tons of ore, having an average value of \$61 per ton, have been extracted and piled up at the mine.

OREGON.

BAKER COUNTY.

At the Wisconsin mine, near McEwen, drifts are being run from both sides of the main shaft at the 200-foot level.

Superintendent J. M. Doyle, the Justice mine, near Sumpter, reports having cut the ledge in the crosscut tunnel 10 feet in, opening up 3 feet of ore. The ore is oxidized.

Manager Hennessey is running a drift at the Gold Bug-Grizzly mine, near Sumpter, to tap the main shaft and arranging to drain the surface water. By this means the shaft can be sunk 200 feet without putting in a pump.

Superintendent J. M. McPhee, the Golden Wizard mine, near McEwen, is putting in a hoisting and pumping plant to sink the shaft 1000 feet. A wagon road has been built from McEwen station to the mine. Manager McPhee says he will put up a mill in the spring.

JOSEPHINE COUNTY.

The Greenback G. M. Co. is putting up a 20-stamp mill and an electric light plant at Greenback, 10 miles from Leland.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The shaft of the Columbus Con. M. Co. at Central City is being sunk below the 200-level. It has been enlarged from two to three compartments. The old hoist is being replaced by a larger one and a Prescott sinking pump has been put in. The vein is 80 feet wide. The 50-ton stamp cyanide mill is running, but a larger one is in contemplation.

The Penobscot M. Co. at Garden City has the new plant completed and is crushing 4000 tons of ore per month, forty stamps dropping in a solution of cyanide. There is room for forty more stamps, and ten will be added early in the new year. The ore is from the Realization mine, developed by a shaft 200 feet deep.

The new steam hoist on the Oro Hondo, joining the Homestake on the south at Lead, consists of a large double-drum hoist, 500 H. P. boilers, air compressor to run twelve drills, and pumps. It is intended to sink 2000 feet. Sinking is in progress.

There are six cyanide mills in course of construction in the district, with the following monthly capacities: Horseshoe, 30,000; Hidden Fortune, 7800; Penobscot, 6000; Hall & McConnell, 1800; Jupiter, 4500; Golden Crest, 1500; total tonnage, 51,300.

The Homestake M. Co. at Lead will double its air pressure in the mine by installing a 100-drill compressor at the Ellison hoist. New boilers are being put in, capacity 1000 H. P. Hereafter it will only be possible to visit the mills and hoists of the company on special permit from the office. It has been fifteen years since the company permitted visitors underground, owing to the annoyance it caused and the liability involved, and it is rarely that a person not in the employ of the company is permitted to step onto one of the cages.

The Globe G. M. Co. has its plant in position in Nevada gulch, 1½ mile southwest of Lead, and sinking has been resumed, hoisting with a gasoline hoist. An air compressor and drills are to be installed. The shaft will be sunk 500 feet.

The Clover Leaf M. Co. has reached the 600 level in the Uncle Sam mine on Elk creek, 10 miles south of Deadwood. The station is being cut on the lower level; when the 700-foot station is cut a pump will be installed, which will have a capacity of 1400 gallons per minute.

The Jupiter Co., near Central City, is

excavating for their cyanide plant, which will have twelve tubs and a capacity of 100 tons per day.

The Penobscot Co. expects to start their mill Jan. 1. They have finished a bunk house for the mill men.

The Portland Co. is prospecting and running machine drills day and night.

TEXAS.

LLANO COUNTY.

The iron mountain at Llano, on the Houston & Texas Central road, is reported sold to Chicago capitalists, the price paid being \$300,000.

UTAH.

BEAVER COUNTY.

A. G. Lewis has bonded the McGregor group on the west side of Gold mountain and will run a tunnel to tap the ledges at depth.

Manager Johnson is driving a tunnel on the Cactus group, near Frisco, which is expected to tap the ore bodies at a depth of a mile. A six-drill compressor is being put up. Mr. Johnson says a concentrator and smelter will be built at the mouth of the tunnel. Through a vein of copper-bearing ore the raise from the 200-level has broken into the 100-level. In 15 feet more the raise from the 300-level will connect with the ore body on the 200. On the west the ledge has been crosscut for 20 feet, with one wall exposed. Along the strike drifts are being extended.

Manager M. J. True, of the Bluebird Copper-Gold M. Co., whose properties are near Milford, says work will be resumed. The shaft on the Bluebird, now at 275 feet, will go deeper.

Manager Johnson of the Cactus, near Beaver, says the upraises between the first and second levels and from the third to the second have broken through. They are in chalcopryite which averages 12% copper. A 6-drill air compressor and boilers are being installed. Twenty-five men are at work.

Manager Colcord of the Excelsior mine and mill, at Frisco, has resumed and has cut the original vein in the tunnel. The Admiral M. Co. is working its 1500-foot tunnel and has ore.

BOX ELDER COUNTY.

President P. W. Madison, Century M. Co., reports a \$3200 bar of gold bullion as the result of the last ten days' run in November at the company's mill in Park valley.

The Century, of Park valley, shipped last week a bar of gold bullion worth \$3200, the proceeds of ten days' run at the mill. The ore assays \$10 per ton.

GRAND COUNTY.

The drift being run to reach the bedrock at the Basin placers, near Pinhook, is in 300 feet. McDonald, Robinson & Emmet will work the mine all winter. They have a vertical depth of 60 feet in surface wash.

JUAB COUNTY.

Dry concentration is having another trial at the May Day of Tintic.

The Miner reports a strike of argenterous ore in the property of the Clifton Copper Belt M. Co., in Willow Springs district, Deep Creek, near Eureka.—An electric hoist is being installed at the Yankee over the winze in the tunnel.—The crosscut from the 500-foot level of the La Clède shaft has cut the vein, which is 7 feet between walls. A 4-foot breast of ore samples 7% copper, with gold and silver.

PARK COUNTY.

The Montana Coal & Coke Co. has begun operations at Horr. There are 250 coke ovens with a total capacity of 9000 tons per month. The company has an electric tramway connecting Horr with Aldridge. They employ 350 men.

SALT LAKE COUNTY.

The Tribune says the Utah Con. M. Co. has ordered a dividend for the Highland Boy of Bingham of \$1.50 a share, or \$450,000, payable January 1. At present the company is producing 50,000 pounds of bullion daily, carrying copper, gold and silver, from 515 tons of ore.

The Old Catwawa M. Co. has incorporated; T. Botkin, C. H. Chandler, T. F. Chanton, D. E. Sloan, H. P. Repman, F. W. Allison, O. Potter.

The Tribune says 300 tons of ore per day are being delivered at lower terminal by the United States tramway at Bingham. Of this, forty-five tons comes from Old Jordan branch.

The smelters in Salt Lake valley reduced during the month of November 56,500 tons of ore.

The Tintic M. & D. Co. has bought the Honest Abe and May claims, lying between the Yampa and Highland Boy Con. group, near Bingham.

The Tintic M. & D. Co. will erect a smelter on the company's Bingham property the coming season. The site has been selected and work will be begun on the building in the spring.

G. H. Robinson, manager of the Yampa

mines at Bingham, has gone to Montana to experiment with several carloads of ore at the Heinze smelter at Butte, to determine the style of plant to be erected by his company at Bingham, where there is a flow of 600 gallons of water a minute, which will supply all needs.

SUMMIT COUNTY.

The Greater New York M. Co. has bought the J. I. C. and R. P. H., two patented claims adjoining the New York M. Co. properties at Park City for \$20,000. J. N. Ferguson is manager.

The Cincinnati Con. M. Co. is incorporated, with Salt Lake City headquarters, for \$500,000, to develop the four Cincinnati lode claims in Uintah district; J. A. Kirby, E. D. Woodruff, A. Hanauer, D. S. Taggart, J. Oberndorfer.

The new boiler and air compressor for the Hawkeye McHenry have been placed.

The Cincinnati Con. of Park City has been incorporated. The company's headquarters will be in Salt Lake. The officers are J. Kirby, president and general manager; E. D. Woodruff, vice-president; A. Hanauer, secretary and treasurer, who with D. S. Taggart and J. Oberndorfer makes the directorate. This company has twelve claims at the head of Deer valley.

Superintendent Rood of the Ontario reports a strike in the shaft on the 2000 level. When the shaft repairing is done, a station will be cut at the 2000 and a drift run to the Ontario vein.

At the Nalldriver a foot of ore was found while excavating for the boarding house which gave 110 ounces silver.

UTAH COUNTY.

The American Fork M. Co. at American Fork have cut the ledge in the tunnel at a depth of 200 feet. The ore shows 32% lead, 59 ounces in silver and \$4 in gold per ton. On the company's Healy claim a ledge carrying 35% lead has been opened to a depth of 80 feet by a shaft. A 200-foot tunnel will be run to get under the shaft.

WASHINGTON COUNTY.

The Tribune says operations at the Grand Gulch on the Utah-Arizona strip, near St. George, have been suspended by the company, but a contract will be let to sink the shaft deeper.

WASHINGTON.

CHELAN COUNTY.

Operations on the Crown Point, at the head of Railroad creek, in the Lake Chelan district, are stopped for the winter. During the summer 75 feet of tunnel were driven and an adjoining claim added to the company's holdings. In addition to gold and copper, the Crown Point contains molybdenite.

The lower tunnel on the Holden property is in 275 feet.

FERRY COUNTY.

Contracts to ship 1000 tons of Quilp ore to the Tacoma smelter have been made, and two cars of ore sent to the works on Puget sound. It is expected to ship fifteen cars monthly from the dump containing 2000 tons, in addition to the regular output of fifty tons a day sent to the Granby smelter at Grand Forks.

Shipments of Granby ore to Granby smelter have averaged \$23 a ton. The ore on the dump which will be sent to the Tacoma plant will run \$15 or \$20.

From the California mine a carload of ore has been sent to the Hall Mines smelter at Nelson, and five carloads to the Tacoma smelter. The shaft at the mine is down 460 feet and is being sunk and timbered at the rate of 2½ feet a day, the quickest time in shaft sinking ever made in this camp. A station will be cut at the 500-foot level and drifting started, after which sinking will be resumed.

OKANOGAN COUNTY.

W. T. Mendenhall of St. Paul, Minn., has gone to Chesaw to make the first payment on a bond for \$40,000 on the Grant group of claims, on Buckhorn mountain, owned by Grant & Anderson. The Grant mine has a vein 50 to 60 feet wide, carrying copper and gold, with a 6-foot streak.

Five carloads of Black Tail ore have been shipped to the Granby smelter. It came from the main Black Tail vein.

J. Carignan and B. Spada, working the Libby, in Silver Creek district, report a body of arsenical iron ore carrying values of \$21 gold and \$2 copper.

WYOMING.

ALBANY COUNTY.

A strike of platinum is reported in the Lookout Jack, which is one mile south of the Ramhler mine. The ore runs \$7 in gold. The mine is owned by Fox, Hegewald and others of Laramie.

CARBON COUNTY.

Manager Bowen of the Ben Hur M. Co. at Battle Lake will resume work on the

Lena Shields group at the head of Cow creek. The tunnel will be driven ahead.

The Pearl lode, in the Battle Lake district, is reported sold to Delaney Bros. of Cripple Creek, Colo. The claim consists of twenty acres and the ore contains gold and copper.

UINTA COUNTY.

A decision is made by the Secretary of the Interior in the controversy between the American Con. Oil Co. and the Union Pacific in favor of the railroad company. The trouble involved the ownership of lands upon which the Spring Valley coal mines are situated. The Secretary held that the lands in question are more valuable as coal lands than as oil lands, and, as oil lands, are not exempt from the railroad grant for this reason. The Spring Valley oil fields lie largely within the boundaries of the government grant to the Union Pacific, and the ruling will affect companies and individuals aside from the American Con. Oil Co. While the question of the ownership of the lands has been in dispute much development work has been done.

FOREIGN.

AUSTRALIA.

QUEENSLAND.

The water supply for the company at Mount Morgan has been kept up and work proceeds in the Premier mine. The ore treated during October was 21,311 tons, yielding 13,816 ounces gold.

The old Champion reef, now known as the Golden Bar Co., lately sent five tons of ore to Cockle Creek, New South Wales, for treatment, which yielded ten ounces eleven pennyweights of gold per ton.

BRITISH COLUMBIA.

The Lardeau-Duncan Dev. Co. has been incorporated by Minneapolis, Minn., men to operate the Primrose and the Golden Circle properties, near Ferguson, on the North Fork. J. M. Miller is president.

Operations have been resumed at the Homestake mine in the South Belt with fifteen men. The Velvet has suspended shipments, pending alterations to its hoisting plant.

Surveyors for the Canadian Pacific railroad have found, between Lodge Pole creek and headwaters of Flathead river, seams of workable coal from 4 to 30 feet thick. They have run open cuts and faced off the seams ready to take out the coal as soon as transportation is obtained. This field is near the north Kootenay pass.

It is estimated that the placers of East Kootenay creek have yielded \$16,000 this season. They are worked largely by Chinamen.

A strike of ore in the Cariboo-McKinney Co.'s Cariboo mine at Camp McKinney at the 400-foot level west has been made. Heretofore the pay ore found has been to the eastward.

The face of the drift, 160-foot level of the Waterloo mine, Camp McKinney, shows 5 feet of gold quartz.

The French company, Societe Miniere, operating in Atlin district placers, has cleaned up for the season, the first two days' shoveling giving 196 ounces gold, the next ninety ounces.

Twenty-five men are working at the Raco mine, near Nelson, and are shipping twenty-two tons per week.

The largest nugget found in Atlin district during the season weighed twenty-eight ounces and was found on the ground of the Atlin M. Co. Pine creek will be dredged by an American company which is putting in a dredger. The machine consists of an endless chain of sixty-four buckets, each weighing a ton. These buckets dig into the gravel and dump into a hopper at rate of eighteen per minute; 3000 gallons of water per minute is forced through the screen and the gold is washed out and onto tables. The dirt, boulders and gravel are elevated and deposited behind. The dredger will dig 3500 cubic yards per day.

The Second Relief mine at Erie has been shut down, owing to shortage of water and lack of facilities for keeping the cyanide plant from freezing. The stamp mill and cyanide plant have been running steadily through summer.

The Dumas G. M. Co., operating the Dumas mine on the north fork of the Wild Horse creek, are prepared to continue work all winter.

The Northwestern Development Syndicate has paid \$16,500 to A. F. Rosenberger on the Camborne group near Goldfields. Work is in progress. It is the intention to erect a stamp mill early in the spring. A contract has been let for the transporting of 1000 tons of ore from the Hunter V. mine, near Ymlr, to the railway. Ore will be shipped to the Hall smelter.

The discovery of platinum in ore is reported from the Contact mines in Burnt basin.

B. N. White, of Spokane, has bonded the Bayonne mine for \$50,000, 10% down. The Bayonne, which was located last fall,

was the first location in an almost virgin country lying between the south end of Kootenay lake and the Salmon River valley.

The North Forks Placer Co., owning placer claims along Salmon river, has decided to build a dam across the North Fork of Salmon and put in 1½ mile of sluices for operating giants next summer. The company has a concession from the crown giving it 170 miners' inches of water for this purpose. The water will have a 200-foot head.

The Granby mines, near Phoenix, are shipping fifty-two cars of ore daily, which is double the tonnage of the last several months.

It is reported that H. H. Claudet of London, representing the Canadian Oil Co., will put up at Rossland a plant for experimental work on the ores of that district.

The tramway between the Venus mine and the Athabaska mill at Nelson is in operation. An average of twenty-five tons a day will be handled.

The Cherry Creek G. M. Co. has been incorporated by St. Paul, Minn., men to operate seven claims adjoining the Morgan group, near Nelson. A bond was taken on four claims and an option on the other three. Three tunnels will be driven on the Mascot claim.

The manager reports shipments from Le Roi No. 2 in October amounted to 2413 tons; contents, 1042 ounces of gold, 3360 ounces of silver, 66 tons copper. The returns from ore amounted to \$19,390; have located with diamond drill on 300-foot level to west of tramway dike upward continuation of ore body. Over foot wall stope above 500-foot level diamond drill core shows the ore is 10 feet thick; average of three assays is, gold \$96 per ton, copper 2½%. Will probably require to crosscut to the south 95 feet to open shoot; have started to crosscut for ore body.

MEXICO.

CHIHUAHUA.

Manager J. R. Roslyn says he will resume operations at the Santo Domingo placers on Concha river, 80 miles east of Chihuahua. The method of treating the dirt is by steam shovel and sluices. There are 3000 acres of this ground.

The sampling works of the Campana Metalurgica de Torreón, S. A., at Chihuahua, are in operation. The works are situated in front of the Mineral railroad depot.

SONORA.

(Special Correspondence).—The Alma M. Co. at Carbo are installing a gasoline engine and will use California oil for fuel. They are doing development work and have 1500 feet of shafts and levels. When they reach water level they will determine as to the best treatment and then erect a mill or smelter. Ores are carbonates and oxides at present. Carbo, Dec. 5.

At Penasco Quemado, in the Altar district, the Sonora M. & M. Co. are developing the ore body recently discovered. It is reported the company will change the reduction process, the smelter having proved unsuitable to the ores.

The Yaqui C. Co. is developing the coal veins found on the land grant owned by the company. The coal is bituminous.

At Las Planchas de Plata, in one of the properties of the Big Mountain M. Co., a new tunnel has cut the ledge 250 feet below the surface, opening up a body of silver ore. The company is operating a 10-stamp mill, but will add to its capacity.

Eight converters are running at Cananea. The carpenters are building coal and coke bins of 300 cars capacity.

Secretary Hay has sent to Ambassador Clayton, at the City of Mexico, a memorandum of protest lodged by citizens of Indianapolis against the Judge and other persons at Cananea for the seizure of copper mines owned by Americans, with the request that the matter be brought to the attention of the Mexican Government.

ZACATECAS.

Near Zacatecas, the San Rafael syndicate has 1000 men at work and development work is being pushed. Cyanide plants with a capacity for treating 100 tons daily are in operation on the La Central.

JAPAN.

Yokohama reports a placer gold field discovered in Kongowaken, near where a trial working of a gold reef has been made. Japanese law forbids aliens to mine placers.

KLONDIKE.

It is reported from Dawson that the best pay yet found on Henderson creek was struck late in November on the Sixty Pup by J. Williams and partners, pans running from \$3 to \$21. Between thirty and forty cabins were built along Henderson creek last summer. Rampart was nearly depopulated in October by a stampede to the upper part of Hootalan river, in the Minook district.

Personal.

B. C. RIBLET, of Nelson, B. C., is in Encampment, Wyo.

V. CLEMENT of Salt Lake has returned home from Mexico.

PERCY MCGEORGE has returned from California to Leadville, Colo.

W. H. WICKHAM of Denver, Colo., has returned there from the East.

W. J. SEEP, of El Paso, Texas, has returned there from Denver, Colo.

A. C. BEATTY of Denver, Colo., is in New York to meet J. H. Hammond.

W. S. TYLER is expected to return from Utah to Denver, Colo., next month.

MANAGER WOLFE, the Polaris M. Co., Clifton, Ariz., is visiting in Virginia.

H. LOMAS, Denver manager for Crocker-Wheeler Co., is in the City of Mexico.

T. L. WALDEN is superintendent of the Alliance tunnel, near Park City, Utah.

MANAGER F. R. REED of the Liberal M. Co., Hailey, Idaho, is in New York.

F. H. PERKINS, of Salt Lake, Utah, is at Silver City, N. M., examining mines.

F. DALY has been appointed foreman of the Silver King mine at Park City, Utah.

M. S. EFFINGER, manager of the Wolverine at Park City, Utah, has gone East.

L. C. TRENT, mining operator, has returned to Salt Lake City, Utah, from Palo Alto, Cal.

SUPERINTENDENT ICKES of the Liberal group of mines, near Hailey, Idaho, is in the East.

A. GRAVES, of Denver, Colo., is in Carbo, Sonora, Mexico, looking after mining interests.

W. L. WATTS of Los Angeles has been in Tucson, Arizona, inspecting mines in that vicinity.

F. W. FOSBERG, manager Corbin concentrator, has returned to Helena, Mont., from the East.

F. M. DRESCHER, of Denver, Colo., assumes a position at the smelter in Verde, Arizona.

L. SEARING, general manager Denver Engineering Works Co., Denver, Colo., is in New York.

W. T. MENDENHALL of St. Paul, Minn., is in Chesaw, Wash., where he has bought a group of mines.

W. H. GEORGE is manager the Buckhorn Extension and Snowden group, near Central City, Colo.

O. L. DUFFIELD, Rollinsville, Colo., is manager the Mountain Monarch M. Co., near Central City, Colo.

E. R. ABADIE, superintendent of the Champion M. Co., Nevada City, Cal., has left for San Francisco, Cal.

T. S. DAYTON, resident manager Mexico M. & S. Co., Mexico City, has returned there from Denver, Colo.

A. VEITCH, assistant manager the Arizona Copper Co., has returned to Clifton, Arizona, from a visit to California.

A. BUCKBEE, general manager Virtue Con. M. Co., Baker City, Or., is in Montreal, Canada, on company business.

J. T. KESSEL has gone from Park City, Utah, to Mill City, Nev., to take charge of the mill of the Sheba M. & M. Co.

W. R. THOMAS, superintendent Central Eureka mine, Sutter Creek, Cal., has returned to the mine from Berkeley, Cal.

J. K. VANATTA and C. C. BAUM of the Spearfish G. M. & M. Co. have returned to Spearfish, S. D., from Colorado Springs.

A. W. BURCHARD, vice-president of the Greene Con. C. M. Co., Cananea, Mexico, has returned from a trip to Los Angeles, Cal.

J. T. KESSEL, former superintendent of the Anchor, Park City, Utah, is superintendent Sheba G. & S. M. Co., Star City, Nev.

F. J. CANNON has returned to Salt Lake, Utah, from Cherry Creek, Nev., where he has been making mine examinations.

SUPERINTENDENT C. E. PURRINGTON of the Fremont Con. M. Co. has returned to Amador City, Cal., from San Francisco, Cal.

W. L. CLARK is manager Quentin Investment Co., Cripple Creek, Colo., successors to the R. C. Bogy Investment Co. of Denver.

D. E. BIGELOW, recently of San Francisco, has gone to Kalgoorlie, West Australia, to take charge of a mining property there.

SUPERINTENDENT G. C. KIRBY, Electric Light mine, near Confidence, Cal., has returned from a business trip to San Francisco, Cal.

W. E. PROCTOR of Sutter Creek, Cal., after a visit to his home and to London, has returned to resume the management

of the Mina Esprito, at Cana, Colombia, South America.

F. RICHMOND has returned to Salt Lake, Utah, from Park City, Utah, where he has placed a new hoist on the New York Bonanza.

G. LEZINSKEY, president of the Gold Tunnel M. Co., Nevada City, Cal., has returned to San Francisco, Cal., from a visit to the mine.

W. H. HAMPTON has resigned the management of the Columbia Mines Co. and will engage in general engineering at Grant's Pass, Or.

J. R. H. ROBERTSON, chief chemist for the Gold & Silver Extraction Co., Denver, Colo., sails to-day for Scotland. He returns in May, 1903.

E. MCCORMICK, of Lordsburg, N. M., former superintendent Aberdeen Copper Co., goes to Durango, Mexico, in the same capacity for the Penoles Co.

J. T. HENLEY has resigned as superintendent Elkton mine, Cripple Creek, Colo., being succeeded by Mr. Winslow, formerly assistant superintendent.

DR. DAVID T. DAY is in San Francisco on business connected with the mining and metallurgical display at the St. Louis, Mo., Exposition, of which he is manager.

Book Notices.

"Locomotives; Simple, Compound and Electric," by H. C. Reagan, locomotive engineer; 12mo. XIII + 604 pages, 309 figures, including many half-tones. Fourth edition by a standard authority on this subject; increased by 131 pages and 83 figures over preceding edition, cloth, \$2.50. John Wiley & Sons, New York.

Commercial Paragraphs.

THE Holtboff Machinery Co., through T. Fielding, their Denver agent, have an order for fifteen cyanide tanks, weighing 210 tons, from the Telluride Reduction Co., Colorado Springs, Colo., for their new mill.

THE Crocker-Wheeler Co., through their Denver, Colo., house, have supplied the Western Packing Co. of Denver with a large number of dynamos and generators. The plant will be in operation December 15.

THE Llewellyn Iron Works of Los Angeles have an order from the Gold Road M. & Ex. Co. of Acme, near Kingman, Ariz., for a complete cyanide plant, capacity 150 tons, and Cornish type of crushing rolls for their mill; rolls 40 inches diameter by 16 inches width of face.

AMONG recent orders taken by the Colorado Iron Works Co., Denver, Colo., is a 30-stamp mill and concentration plant for El Carmen Copper Co., Durango, Mexico; twenty-four impact screens, crushers and rolls for the Gold Road Mining and Exploration Co., Acme, Arizona.

IN the burr slot screen when sheets were punched by hand and holes gauged by a common needle the burrs could not be avoided and the clean cut perforations of machine work could not be obtained. Most screens are now punched without burrs. Tinned plates are still used in 10x14-inch and 14x20-inch sheets in sectional frames. The tin is burned off before using. The American Engineering Works, Chicago, makes many burr slot screens and many tinned screens in compliance with orders. It has introduced two improvements, first punching the black pick metal instead of the tinned metal to save the trouble of burning off tin. Then came the suggestion: Why punch this soft metal at all when hard steel equally thin can be punched. So a number of parties have accepted the substitute of thin hard steel punched with fine holes. These screens are said to give the free discharge which cause mill men to favor tinned screens, and last longer.

THE Crocker-Wheeler Co., Ampere, N. J., manufacturers of electrical machinery, have included among their shipments of engine type generators for the month of November, one size 336, 400 K. W., for the Stevens-Girard Building, Philadelphia, Pa.; one size 111, 100 K. W., one size 140, 125 K. W., for the Missouri Pacific Railway, St. Louis, Mo.; two size 168, 150 K. W., for the Penna. Malleable Co., McKees Rocks, Pa.; one size 224, 200 K. W., for J. L. Mitchell, Philadelphia, Pa.; two size 55, 50 K. W., for the Live-right & Greenwald Mfg., Philadelphia, Pa.; two size 140, 100 K. W., for the McClintic-Marshall Construction Co., Pottstown, Pa.; one size 336, 300 K. W., for the Grand Crossing Tack Co., Chicago, Ill.; one size 448, 400 K. W., for the Lake Construction Co., Erie county, Pa.; one size 275, 250 K. W., for the Wilmington City Elec. Co., Wilmington, Del.; one size 275, 225 K. W., for the Pine Bluff & Western Ry., Pine Bluff, Ark.; two size 168,

150 K. W., one size 224, 200 K. W., one size 84, 75 K. W., for the Woodward & Lothrop Bldg., Washington, D. C. The company reports that their new mill building is now being occupied, enlarging their floor space by 60,000 square feet, giving increased facilities for prompt deliveries on large orders.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING DECEMBER 2, 1902.

714,851—WINDOW SHADE BRACKET—J. C. Barker, Seattle, Wash.
714,755—LOCATING WATER—F. H. Brown, Los Angeles, Cal.
714,777—SNAP HOOK—C. A. Buck, S. F.
714,878—VEHICLE POLE CAP—B. M. Davis, Los Angeles, Cal.
714,686—SHOW CASE—W. G. Flint, San Jose, Cal.
715,060—BRAKE—R. B. Hahn, Los Angeles, Cal.
715,066—THRESHER—W. A. Hesse, Red Bluff, Cal.
714,695—TRACTION DEVICE—A. A. Honey, Tacoma, Wash.
714,915—CAR BRAKE LEVER—W. C. Keithly, S. F.
715,095—DEPTH INDICATOR—H. S. Lathrop, S. F.
714,922—WRENCH—W. Lee, Los Gatos, Cal.
714,809—NUT LOCK—J. H. Leonard, Woodland, Cal.
714,719—JAR CLOSURE—J. M. Long Jr., S. F.
714,929—GAS GENERATOR—W. S. May, Orlton, Ariz.
714,936—FORK CROWNS—Muller & Jackson, Oakland, Cal.
715,132—CHECKING APPARATUS—A. Nelson, S. F.
715,141—OIL WELL WATER CHECK—W. Plotts, Whittier, Cal.
714,961—EJECTOR—T. S. Smith, Los Angeles, Cal.
715,224—EDUCATIONAL APPLIANCE—C. E. Wheeler, Seattle, Wash.
714,981—OIL BURNER—J. M. Wishart, Pasadena, Cal.
714,989—GRAPPLING TOOL—H. A. Worthington, Los Angeles, Cal.
715,158—STOVE—R. Young, Tacoma, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INTERCHANGEABLE FORK CROWNS.—No. 714,936, Dec. 2, 1902. H. Muller and W. A. Jackson, Oakland, Cal. This invention relates to improvements in bicycle fork crowns. Its primary object is to provide a crown to which the forks may be secured otherwise than by the ordinary method of brazing, which necessarily weakens a vital part of the machine. A further object is to provide a spring fork of extreme simplicity, strength and durability particularly adapted to this crown. It consists of a crown integral with the steering post and having segmental flanges at its ends, fork sides adapted to fit within and be embraced by said flanges, and means for locking the crown and fork sides together.

CAR BRAKE LEVERS.—No. 714,915, Dec. 2, 1902. W. C. Keithly, San Francisco, Cal., one-half assigned to L. H. Brown, San Francisco, Cal. This invention relates to an improved combination lever which is especially designed for use upon street and like cars where hand levers may be employed for the purpose of applying the brake. It consists of horizontally journaled parallel shafts located above the floor of the car, one of said shafts having a lever extending downwardly through the floor for the attachment of the brake-connecting rod, the other lever projecting upwardly and connected by a link with a rock-arm attached to the second shaft and at such an angle with relation to the first lever that when the shaft is turned it acts to first give a rapid movement to the brake and connecting parts, and after the brake has been brought in contact with the wheels the movement of the lever is at such an angle as to provide for a slower movement with greatly increased power to set the brake firmly. A hand lever is connected with the second shaft, through which lever the movements are effected.

Latest Market Reports.

SAN FRANCISCO, Dec. 12, 1902.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, 47½c, refined (1000 fine); San Francisco, 47½c; Mexican dollars, 37½¢ @ 38½¢ San Francisco, 37½¢ New York.

Silver remains practically at a standstill; the slight advance over the quotations of last week has no particular significance.

COPPER.—New York: Standard, \$10.75; Lake, 1 to 3 casks, \$11.65; carload lots, \$11.30; Electrolytic, 1 to 3 casks, \$11.45; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.35; carload lots, \$11.10. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: £50 13s 9d spot per ton.

The market continues firm and under the stimulus of a larger inquiry from consuming buyers bolders are now asking a slight increase over those prices which were current. At the present writing the inquiry is for deliveries extending over the first three or four months of next year, and covers every description of the metal.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½ 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 13s 9d per ton.

SPELTER.—New York, \$4.95; St. Louis, \$4.50; London, £19 17s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$24.85@24.95; San Francisco, ton lots, 27c; 500 lbs., 27c; 200 lbs., 27½c; less, 28c; bar tin, 28½c. London, £112 6s spot.

PLATINUM.—San Francisco, crude, \$18.00 @ oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45.50@46.50; large lots; London, £8 15s; San Francisco, local, \$46.00 @ flask of 76½ lbs.; Denver, \$49.50. Export, \$44.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclips, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.10c.

NICKEL.—New York, 50@60c @ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$24.25; gray forge, \$21.15; San Francisco, bar, 3c @ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$30.50 and \$31; open hearth billets, \$32 and \$34.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.90; K. B. & S., \$3.00; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$3.25 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per hhl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$4.25 @4.50; pickets, \$19.50; shingles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00 @32.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for carload lots.

GENERAL SUPPLIES.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60% carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40% carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$5.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½¢ @ set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c @ lb.; carloads, 24@24½c; in 10-lb. tins, 35c; sulphuric acid, in carboys, 66½ B, 2c @ lb.; soda ash, \$2.00 @ 100 lbs.; hyposulphite of soda, 2½@3c @ lb.; blue vitriol, 5½@6½c @ lb.; borax, concentrated, 7@8c @ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3c; California refined, 2@2½c; nitric acid, in carboys, 8c @ lb.; caustic soda, in drums, 3@4c @ lb.; Cal. s. soda, hbls., \$1.25 @1.50 @ 100 lbs.; sks., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in hbls., 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c @ lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.50; Seattle, \$8.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$8.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8.50, long ton.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, ¾c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb.

above keg price. Dry Lead.—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c @ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 2½c, 60c.

MANGANESE.—(90% and over) @ lb., \$1.25.

MERCURY.—Bichloride, 2½c, 90c.

MOLYBDENUM.—25c @ gramme; 1000 grammes=2½ lbs.

PHOSPHORUS.—(American) @ lb., 80c.

SILVER.—Chloride, 2½ oz., 75c; nitrate, 55c.

SODIUM.—Metal, 2½c, \$1.00.

URANIUM.—Oxide, 2½c, \$3.50.

ZINC.—Metallic, chemically pure, 2½c, 50c.

ZINC.—Dust, 2½c, 10c.

ZINC.—Sulphate, 2½c, .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

Wanted, position as assayer or assistant, Jan. 1st. References. Address Box 13, this office.

Mining Surveyor and Assayer, University graduate, 17 years' experience, desires situation with chance of advancement. Address Box 10, this office.

Cyanide Chemist wants position. Amalgamator and assayer. Graduate School of Mines. First-class references. Address "Cyanide," this office.

Superintendent, competent assayer, chemist and surveyor, experienced in development work, wishes position in any capacity. "Seattle," this office.

Cyanide man and assayer wants position. Can take shift on mill if needed. Practical experience and reliable. C. F., Mining and Scientific Press.

Engineer wants position to run hoist or mill engine or pump. Use to combustion of oil and Corliss engines. Have recommend. Good mechanic. R. Blackwell, Elsinore, Riverside Co., Cal.

All around mechanic, 15 years' experience stationary and locomotive engineer, 5 years foreman of construction and boiler work, wants mechanical position, or engineer on gold dredger. Address C. E. B., this office.

Erecting Engineer and Millwright also Assayer, desires situation. Competent to take charge both of construction and running of plant. Gasoline, steam or water power. Address Box 11, this office.

Competent and reliable technically educated man, 34 years of age, desires position with a good mining company. Has had wide experience in the handling of low-grade gold ores where economy was essential to success. Can give best of references. Address L. D. H., care Mining and Scientific Press.

Mining Engineer with twelve years' practical experience in mines and mills wishes position as superintendent. School of Mines graduate. Has had extensive experience in developing prospects into shape for actual working on a large scale. Also practical cyanide manager, assayer and surveyor. Address "Engineer," this office.

Competent Millman, Machinist and Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 14 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

Wanted, position as manager or superintendent of mining property, or would accept a position as consulting engineer. Have had over thirty years' experience and can refer to some of the best known people, both on this coast and in the East. Salary not so much an object as permanent employment. Address "Mine Superintendent," care of Mining and Scientific Press, 330 Market St., San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by hydraulic process from Frank Mining Co., in Safford Flat Hydraulic Mine, near Nevada City, Nevada County, Cal., draining into Safford Flat Creek which reaches South Yuba River; from A. A. Gorman and A. F. Kavanagh, in Sage Hill mine, near Michigan Bluff, Placer County, Cal., draining into Skunk Creek, which reaches Middle River, American River; from Frank Joseph, in Frank Joseph mine, near Watson Gulch, Shasta County, draining into Roaring River which reaches Sacramento River; and from Alfred Dixon, et al., in Big Gun Gold Mine, near Michigan Bluff, Placer County, Cal., draining into Poor Man's Creek which reaches American River, give notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Dec. 29, 1902, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by hydraulic process from Geo. and Lee Pease, in St. George Mine, near Yankee Jims, Placer County, Cal., draining into Devil's Canyon Creek, which reaches North Fork of American River; and from A. Lundberg, in Old Sluff Gravel Mine, near Vallecito, Calaveras County, Cal., draining into Wades Gulch, thence into Coyote Creek, which reaches Stanislaus River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Dec. 15, 1902, at 1:30 P. M.

WANTED.

Wanted--Foreman for Concentrating Plant, 200 tons capacity, located in Colorado. Must have ability to earn \$300 per month. Address "Mill Owner," care of Mining and Scientific Press.

Wanted, Phosphate Deposits on the Pacific Coast.
Address L. T. W., Mining and Scientific Press.

WANTED.

1 Chlorination Barrel, lead lined, state size.
1 Steam Boiler, 25 to 75 H. P., Preferred.
Must be in good condition and cheap for cash.
Consolidated Loan & Trust Mining Co.,
RENO, NEVADA.

MINING STOCKS WANTED. We have opportunity to sell and frequent calls for many mining stocks. If you have any good stocks that you are willing to dispose of at attractive prices, send your certificates to us. We can sell them for you quickly. Whenever you send us stocks make us your lowest offer. Orders filled at low prices on all stocks. General references: Dun's and Bradstreet's agencies. New York and other bank references given if desired.
35 Wall Street,
CATLIN & POWELL, New York City.

WANTED.

Second-hand, high speed horizontal tandem compound condensing engine, 400 to 500 horse power, arranged for belting; also air pump and surface condenser. But slightly used. Give full particulars.
Address "Electric," care of this office.

ASSESSMENT NOTICES.

INTO MARBLE COMPANY OF CALIFORNIA. Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of November, 1902, an assessment (No. 38) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of January, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3rd day of February, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHARLES E. ANDERSON, Secretary.
Office--Room 31, tenth floor, Mills Building, San Francisco, California.

MARINA MARSICANO GOLD MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of December, 1902, an assessment (No. 33) of one cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 415 Front street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of January, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of January, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office--415 Front street, San Francisco, California.

WILLETTA MINING AND MILLING COMPANY. Location of principal place of business, San Francisco, California; location of works, Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of December, 1902, an assessment (No. 5) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Saturday, the 10th day of January, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2d day of February, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
E. McALLISTER, Secretary.
Office--Rooms 233-234 Crocker Building, corner of Post and Market streets, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 9th day of December, 1902, an assessment (No. 36) of one-half (1/2) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 214 Pine street, room 31, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of January, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 7th day of February, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office--214 Pine street, room 31, San Francisco, California.

DEWEY, STRONG & CO. PATENT AGENCY
330 MARKET ST. S.F.

MACHINERY FOR SALE.

FOR SALE.

1,000,000 ft. of standard black wrought iron pipe, second hand, in good condition, size 3/4 to 12 in.
500,000 ft. of flanged wrought iron casing, size 2 to 6 in.
225,000 ft. of flanged threaded end casing, size 2 to 3 1/2 in.
10,000 ft. of 6-in. riveted steel pipe.

ENGINES.

One 30x60 right hand Fraser & Chandler Corliss engine with flywheel 18 ft. dia. x 44 in. face, complete, in first-class order, ready for immediate delivery.
We also have with this engine a triple leather driving belt 160 ft. (endless).
One 16x38 left hand Corliss engine with flywheel 11 ft. dia. x 30 in. face, complete and in first-class order.
One 24x48 Wheelock Corliss engine.
One 20x33 Webster, Camp & Lane double cylinder double drum hoist.

BOILERS.

One 250 and one 450 H. P. Hazleton tripod boilers.
Two 104 H. P. Ahendroth & Root boilers.
Two 185 H. P. Ahendroth & Root boilers.
Four 250 H. P. Campbell & Zell water tube boilers.
Four 125 H. P. Babcock & Wilcock water tube boilers.
One 75 H. P. Heine water tube boiler.

AIR COMPRESSOR.

One 30x24x24 National Drill & Compressor Co. air compressor.

The above items do not represent all of the machinery we have in stock. In addition, we offer you all kinds of automatic, compound and slide valve engines, ranging in size from 3 to 250 H. P.

Horizontal tubular boilers ranging from 10 to 150 H. P.

Vertical boilers, both submerged and full length tubes, from 5 to 100 H. P.

Fire-box boilers from 15 to 100 H. P.

One Silsby fire pump; besides we have engine, duplex and compound pumps of every size.

100,000 ft. of fire hose from the Pan-American Exposition.

Hoisting rope of all sizes.

Shafting, pulleys, belting and a full line of mill supplies.

Four turbine water wheels from 25 to 80 H. P.

Ask for Our Complete Catalogue No. 360.

CHICAGO HOUSE WRECKING CO.

West 35th and Iron Streets,
CHICAGO, ILL.

AT A BARGAIN.

2 PELTON WATER WHEELS, 6' diameter with sheet steel discs 3/4" thick secured to 3" shafts 4 1/2' long.

42 BRASS BUCKETS, 3" across face and riveted to steel disc 5 1/2" apart.

STAND PIPE FOR TWO NOZZLES, one 1 1/2" diameter, the other 1 1/8" diameter. Lever and hood for closing 1 1/2" Nozzle. Size of Stand Pipe 4" diameter.

2 SHEET IRON HOODS for Wheels.

WHEELS built for 400' head.

Address
CALIFORNIA POWDER WORKS,
330 Market Street,
SAN FRANCISCO, CAL.

Second Hand Machinery.

Specialties:

PULLEYS, SHAFTING, BELTING.
BOXES, BOILERS, ENGINES,
HOISTERS, STAMP MILLS, RAILS,
CABLE, and all but little used.

The S. S. Machinery Co.,
DENVER, COLORADO.

ENGINES, BOILERS, PUMPS, Etc.

THE UNITED RAILROADS offers for sale, in good order, the following machinery:

2 sets of Cross Compound Condensing Engines, Scott & O'Neill cut-off, of 750 H. P. each; cylinders 29 in. x 42 in. stroke, with direct acting air pump and condenser, Union Iron Works, builders. This firm built the U. S. warship "Oregon."
2 Circulating Pumps for condensing plant, Thompson & Evans, builders.
1 Elephant Type Boilers, 60 in. x 18 ft., 150 H. P. each, set independent, Union Iron Works, builders.
2 Boiler Feed Pumps, Thompson & Evans, builders.
1 Deep Well Pump, Thompson & Evans, builders.
1 Double Reversible Link Engine, about 15 H. P.

ALSO,

2 sets of Engines built by the Risdon Iron & Locomotive Works, each set consisting of a triple expansion jet condensing engine 15x24x38 in., of 550 I. H. P., high and intermediate pressure cylinders being tandem, of the Reynolds & Corliss types, and the low pressure being a cross with Myers cut-off, each set having an independent air pump division steam end 12x16 in. with Risdon Iron Works condenser.

5 Sterling Boilers, 250 H. P. each, drums 2 ft. 10 in. x 11 ft., and 244 tubes.

2 Risdon Condensers.

1 Circulating Engine.

2 Risdon Air Pumps 9x15 in.

1 Davidson Fire Pump 5x7x10 in.

2 Davidson Feed Pumps No. 5.

1 Dow Duplex Pump 6x8 in.

1 Centrifugal Pump.

APPLY:

UNITED RAILROADS,

Purchasing Agent,

OFFICE OF GRANITE-BIMETALLIC CONSOLIDATED MINING CO.

PHILIPSBURG, MONT., October 15, 1902.
Consolidation of plants and change to electric power permit us to offer, subject of course to prior sale, the Engines, Boilers, Machinery, etc., covered by the following list, at greatly reduced prices:
SECOND-HAND MACHINERY ON HAND.

ENGINES.
1 Fraser & Chalmers Cross-Compound Condensing Corliss Engine, 22 in. x 38 in. dia. x 80 in. cylinders, 500 H. P., with jet condenser. 1 same as above with Knowles Vacuum Pump and Condenser.
1 Fraser & Chalmers Corliss Engine, 18 in. x 42 in., 227 H. P., at 100 lbs. cut-off at 1/2 stroke. 1 Hor. Atlas Engine, 8 in. x 12 in., 25 H. P. 1 Hor. Atlas Engine, 9 in. x 14 in., 30 H. P. 2 McIntosh & Seymour High Speed Engines 9 in. x 12 in., 30 H. P. 1 McIntosh & Seymour High Speed Engine, 7 in. x 9 in., 15 H. P. 3 Upright Engines, 8 in. x 8 in., 15 H. P.

AIR COMPRESSORS.
1 Ingersoll Straight Line Air Compressor, steam cyl. 24 in., air cyl. 24 in., stroke 30 in. 1 Ingersoll Straight Line, steam cyl. 16 in., air cyl. 16 in., stroke 24 in. 1 Norwalk Compressor, steam cyl. 1 in. L. P., air cyl. 16 in. H. P., air cyl. 10 in. stroke 16 in. 1 Knowles Hor. Compressor Blower, steam cyl. 12 in., air cyl. 20 in., stroke 21 in.

BOILERS.
4 Ret. Tubular, 60 in. x 16 ft., 90 H. P. 1 Ret. Tubular, 60 in. x 12 ft., 70 H. P. 8 Ret. Tubular, 54 in. x 16 ft., 62 H. P. 6 Ret. Tubular, 54 in. x 16 ft., 62 H. P. 2 Ret. Tubular, 66 in. x 18 ft., 100 H. P. 2 Ret. Tubular, 52 in. x 14 ft., 50 H. P. 1 Hor. Economic Loco., 20 H. P.

HEATERS.
1 Tubular Heater, 80 in. x 9 ft. 1 Tubular Heater, 36 in. x 12 ft. 1 Tubular Heater, 18 in. x 9 ft. 1 Tubular Heater, 36 in. x 7 ft. 6 in. 1 Tubular Heater, 36 in. x 10 ft.

AIR RECEIVERS.
6 Air Receivers, 60 in. x 20 ft. 1 Air Receiver, 48 in. x 15 ft. 1 Air Receiver, 36 in. x 13 ft. 1 Air Receiver, 36 in. x 9 ft. 6 in. 1 Air Receiver, 42 in. x 8 ft.

PUMPS.
1 Knowles Compound Condensing Duplex Plunger Pump, special pot-valve pattern. L. P. steam cyl. 24 in., H. P. steam cyl. 14 in. Dia. plungers 8 in. Stroke 24 in. 1 Scotch vacuum pump 8 in. x 12 in. x 12 in. 1 Knowles Compound Condensing Duplex Plunger Pump. 1 L. P. steam cyl. 18 in., H. P. steam cyl. 10 in. Dia. plungers 7 in. Stroke 18 in. Vacuum pump 6 1/2 in. x 12 in. x 10 in. 1 Knowles Double Plunger Pump, special pot-valve pattern, 8 in. x 24 in. steam cyl., 8 in. plungers. 1 Knowles Double Plunger Pump, same as above. 1 Station Feed Pump, 14 in. x 16 in. cyl., 7 in. plungers. 4 Boiler Feed Pumps, 8 in. x 10 in. cyl., 5 in. plungers. 3 Knowles Sinking Pumps, 14 x 7 x 5 x 10 in. 1 Knowles Sinking Pump, 12 x 8 x 6 x 12 in.

PLANERS.
1 Iron Planer, 7 ft. x 21 in. bed, planes 24 in. big, 24 in. wide, ways 9 ft. 6 in. long (Lath & Moree Tool Co., Worcester, Mass.). 1 Planer, 20 in. x 5 ft. bed, planes 2 1/2 in. wide, 24 in. big, ways 7 ft. 6 in. long. 1 L. B. Reed (Calro, Ill.) Planer, planes 30 in. x 30 in. between uprights, 2 1/2 in. x 9 ft. 6 in. long.

LATHES.
1 Field Engine Lathe, swing 30 1/2 in. Dia. centers 16 ft., bed 21 ft. over all. 1 L. B. Reed (Calro, Ill.) Lathe, swing 24 in. Dia. centers 8 ft.

DRILL PRESS.
1 Vertical Drilling Machine, table 20 in. dia.

BOLT CUTTERS.
1 Bolt Cutter, hand or power, cuts pipe up to 2 in. dia. 1 Bolt Cutter, cuts pipe 1 1/2 in. and under.

DYNAMOS.
1 T. H. Motor, Type "E," 250 light, 110 volt. 1 T. H. Motor, 250 light, 110 volt. 1 T. H. Motor, Type "E-1," 200 light, 110 volt.

DIAMOND DRILL.
1 American Diamond Rock Boring Co., 115 Courtland St., New York. Double cylinders 4 in. x 4 in., tube bore 1 7/8 in. Drills 1 1/2 in. hole. For steam or air.

For further information, prices, etc., address

The Chloride-Bailey Mines, Trinity County, Cal.

Noted among the gold mines of northern California is the Chloride-Bailey, 2½ miles northeast of Dedrick, in Trinity county. The mine has been worked for years, originally in a superficial manner, but in more recent years in deeper levels. At present a cross-cut tunnel 525 feet long is the main entrance to the mine. This follows a large dike which intersects the hornblende schist forming the country rock. The vein system is clearly defined for several thousand feet along its strike at the surface and is accompanied by dike rocks, which together with the veins cut through the dike previously mentioned. A winze has been sunk on the vein below the tunnel level by means of a hoist run by compressed air, to a depth of 250 feet. This equipment is capable of sinking 1000 feet. The vein in the lowest workings is 10 to 12 feet wide with a paystreak 5 to 6 feet wide. In the upper workings it is 3 to 4 feet. The shoot is 400 feet long. There are two mills in operation—an old 10-stamp mill near the mouth of an upper tunnel, and a new one of twenty stamps at a point several hundred feet distant from the first mentioned and several hundred feet below it. The mill is connected with the mine by aerial tramway.

At the site of the old mill a large quantity of tailings has accumulated and a seventy-five-ton cyanide plant has been built to treat them. Southwest of the old workings the vein has been discovered near the site of the new mill, an illustration of which appears herewith, and here a new tunnel has been started which will be driven by machine drills about 5000 feet to the main shoot, with the probability of encountering other shoots on its course. This tunnel

At the Mouth of the Upper Tunnel, Chloride-Bailey Mine, Trinity Co., Cal.

will reach the main shoot at a depth of 1800 feet. The other accompanying illustration is that of the building at the mouth of the upper tunnel.

The Chloride-Bailey mines have been systematically worked since their discovery, each step in the development being carefully considered before undertaken. The mine was originally worked in the oxidized zone by means of adits and short crosscuts to the vein. Homer Wilson of San Francisco, Cal., bought the property and drove the present main crosscut, developing the mine several hundred feet below any of the former workings, and the mine proved to be better than the upper workings indicated. The long tunnel from the new mill will be an expensive undertaking; but the present condition of the mine not only justifies, but demands, either the long drain tunnel or a shaft from the surface, and there can be no doubt that the tunnel is by far the better plan.

A FEW weeks ago appeared herein an article on the discovery of a method of manufacturing nitric acid from the nitrogen of the air. It is now announced that Prof. Edward O'Neill, of the University of California, at Berkeley, Cal., has found a means of abstracting cyanogen from the air, and has applied his discovery to the experi-

mental making of potassium cyanide. This process is analogous to that of making nitric acid from the air. By a long series of experiments, Prof. O'Neill has discovered that by employing a hydrocarbon vapor, such as is produced by petroleum, gasoline, coal gas, etc., in combination with nitrogen and exposing them to the influence of the electric arc, he can produce hydrocyanic acid. Potash (potassium hydroxide) will absorb a large volume of this acid and then becomes the substance known throughout the mining world as cyanide of potassium. That the discovery of Prof. O'Neill is likely to become an important one to the mining industry is at once apparent. If it is found that potassium cyanide can be manufactured in commercial quantities at a cost considerably below the present expense of manufacturing this necessary substance, the value of the discovery is almost immeasurable.

ON the 14th inst. was successfully started the new Pacific cable from San Francisco, Cal., to Honolulu, U. S. A., thence to the Philippines and China. This means much to the mining and manufacturing interests of the Pacific coast, which has long been the back door of the nation, but with instant communication with the Orient, faces around and becomes the nation's front door, so far as are concerned the countries whose coasts are washed by the waves of the Pacific. It is the beginning of the change that will convert earth's greatest ocean into an American lake.

THE MOUNTAIN COPPER Co. at Keswick, Shasta county, Cal., whose miners and smelter men are out on strike, has met a committee of the business men of Redding, Cal., which was acting as an arbiter in the difficulties, and has positively declined to recognize the union, though professedly willing to arbitrate matters on other lines. Present appearances indicate a long shut down of the entire plant.

THERE is a more general tendency toward the introduction of mechanical haulage underground in larger mines everywhere. Managers are awakening to the fact that where a large tonnage is handled it is more economical to transport by means of a continuous rope device than to employ so large a number of men as trammers.

THE MINERS and foreigners of Mexico are strenuously opposing the demonetization of silver, and the consequent increase in price of the necessities as well as the luxuries of life.

THERE is no better index to the general business and financial condition of the country than the condition of the iron market. It is the thermometer or barometer of our industrial life.

THE United States Supreme Court is hearing argument in a case involving the question whether or not granite shall be considered a mineral. This is in the case of the Northern Pacific Railroad vs. J. A. Soderberg of the State of Washington, defendant having located a granite quarry on railroad land. The railroad people are endeavoring to prove that granite is not mineral, with what success remains to be seen.

THE MINE OWNERS of Butler, in the Tonopah district of Nevada, are seeking a process which will cheaply reduce the complex low-grade ores from the lower levels of their mines. The high-grade ores afford no problem, as these can be shipped. There is no doubt a solution can be found to accomplish the desired end, if not already found in the process described in the MINING AND SCIENTIFIC PRESS of the 13th inst. under the caption of "Cyaniding Silver Ores," but an equally serious problem confronts the district in the scarcity of water. Ingenuity and the value of the ores of the district will also solve this problem. It is not unlikely that in depth the mines of the district will themselves supply all the water required. They will be fortunate, indeed, if they do not find too much, as is often the case when desert mines do reach the water line.

THE great dam across the river Nile in Egypt is completed. It is one of the finest examples of successful engineering in modern times. The foundations are laid in a deep trench cut in the granite bedrock. In the construction of the dam the presence of the islands in the stream was taken advantage of and temporary dams built, the water being pumped out below to permit the excavation of the trenches and the laying of the foundations. This process was repeated three times. The dam has a length of about 6500 feet and is 60 feet wide at the top. It is estimated the dam will impound 100,000,000 tons of water. This structure has cost the British Government about \$25,000,000 and will make it possible to irrigate a large area—nearly 800,000 acres. It will also increase river and railway traffic by reason of increased production in the region. Twenty-five thousand laborers were employed in the construction of the dam, working night and day.

Timidity in Mining.

That there is any substantial reason why capital should be timid or fearful in engaging in legitimate mining is not apparent. Monied men engage vigorously in other pursuits—manufacturing, merchandising, farming, etc.—without hesitation, when to the impartial and capable observer there seems to be no more assurance to the investor in these several lines of industry than there is in investing in legitimate mining. So often have the phrases, "Mining is a gamble," "Mining is unsafe," or, "Mining is a lottery," been repeated that the average capitalist who has not learned from practical experience that mining is not more of a gamble, or a lottery, or less secure than the average of other pursuits and investments, has come to firmly believe these sayings to be absolutely true.

There are many millionaire miners who have made their money in the mines, who do not agree with the conservative capitalist, who is conservative as to mine investments only.

Industrial failures, crop failures and merchandising failures are of no less frequency than mining failures where they were based on common sense. As a matter of course there is a wide range in the character of mining investments. Those who are seeking an investment as secure as government bonds will buy stocks in mines which have been operating successfully for many years, where the output is steadily maintained; where dividends are as regular as the changes of the moon, and where the management has been proven to be efficient and conservative. Prominent in this class are such stocks as the Calumet & Hecla of Lake Superior and the Homestake of South Dakota. In the next class are those which pay dividends, but which have not been in operation a sufficient length of time to secure absolute confidence, but which still give abundant evidence of ability to maintain their record, and in time promise to take place with those of the first class.

A third class is of the transitory sort, but which withal form an almost irresistible attraction to the investor. Among these there are many mines which have had meteoric careers, bursting suddenly into view, quickly making millionaires of comparatively poor men and rapidly waning until almost lost to sight. This class of investments is all right for those who get in early, but often disastrous to those who come in on the crest of the wave of its prosperity. They are likely to be swept to destruction by the undertow of shrinking values.

Another, and somewhat different class, and certainly a class that is recognized by those most competent to judge, as legitimate and as safe as any other unproven enterprise, is the prospect which promises well. By a promising prospect is meant a property wherein the values and economic conditions insure success if they continue, and wherein the only element of uncertainty is the extent of the ore bodies and their value beyond the point of development. By approaching this class of investment in a common-sense manner with the aid of competent assistance, which should be of the highest integrity, disaster is a remote contingency.

To plunge wildly into such an investment, equipping a shallow shaft with heavy and expensive plant, building immense mills or smelters where testing works or small plants only are advisable, will often place the investor upon the high road to failure. Without being "penny wise and pound foolish," plunging is not good business in mining or in any other branch of industry.

It is the "wildcat" investment that the capitalist must handle with caution. There are numerous "wildcats" in the market, and, unfortunately, many investors are led into investing in them to their sorrow. Even a "wildcat" is not always to be "turned down," for these are sometimes alluring, with reasonable chances that an investment of this class may prove a success. A property having little or no development may lie contiguous to a valuable mine, wherein the indications are that the ore bodies will extend into the adjoining property. Such an investment makes a good business proposition, but should be approached with caution. The Consolidated California and Virginia, on the Comstock, was just such a proposition. Nothing within itself developed, but having good mines on either side of it, the good judgment, courage and business sagacity of J. W.

Mackay and his associates led them to the greatest bonanza the world has ever known.

But there are "wildcats" that will always remain "wildcats," and to distinguish among the numerous mining propositions offered the public in these days of mining and industrial prosperity—to separate the wheat from the chaff—the average investor should take means of ascertaining from some other source than the promoters the character of the enterprise under consideration before investing.

Capital is timid, but there is no reason why it should be more so in mining than in any other business, if the capitalist will investigate the proposed investment with the same care and caution he would employ if he were about to buy a foundry, farm or merchandising establishment.

FOREST examination in the mining regions of the United States became a part of the work of the U. S. Geological Survey some time ago. The result so far indicates that of forest denudation 90% is due to fires and 10% to legitimate timber cutting. To preserve the forests for the use of the miner and rancher is the province and purpose of the U. S. Geological Survey, the governmental policy being to protect and foster the mining industry, though public sentiment does not always accept this fact. Another branch of the U. S. Geological Survey has to do with the collection of statistics of mines, mining and mineral production, which is also of great present value to the mining industry, the statistical volumes issued by this branch of the survey being accurate and timely and are the subject of world-wide commendation. Next to the Geological Survey, the General Land Office has considerable to do with the miner, through the local land offices and accredited Federal agents. The topographic and map work, which is admirably done, is also an important adjunct to the development of our mineral resources.

THE THREATENED complete destruction of the entire north temperate zone by the re-encroachment of a vast ice sheet from the north is a contingency so remote that even the prophets of evil themselves have no immediate fear of it. That such a thing as a return of the ice is possible, no one familiar with the broad principles of geology will deny, but great geological changes do not occur in a day. They require many thousands of years for their accomplishment. The uplifting of a mountain chain is scarcely more rapid than the destruction by erosion of one already built. Many centuries would come and go before sufficient snow would fall in the north frigid and north temperate zones to a depth sufficient to again form an ice cap which by the superior thickness and weight of its northern portion would cause its southern portion to slowly but irresistibly encroach upon and destroy all that now exists in the north temperate zone.

THE zinc mining companies of Joplin, Mo., district have united for the purpose of exporting several thousand tons of zinc ore, with a view to creating a raise in price. The same result might be attained by a combination or agreement among the several companies to apportion the output according to the ability of each mine to produce ore, as was done in the quicksilver mines of California. This to some extent prevents overproduction and has a tendency to keep up the price of spelter. Closing down of the mines for short periods to restrict output is a less satisfactory method, perhaps to the mine workers, as in order to work in the most economical manner, each mine should be run to the extent of its capacity. It seems, however, to be a choice between overproduction and low prices, and restricted production and better prices.

IN THIS DAY of gigantic trusts and mergers no attempt has yet been made to form a consolidation of the gold mines of the world. Doubtless this has received some thought, but the undertaking is too large for ordinary financiers who only deal in the "hundreds of millions class" of securities. But men of the Cecil Rhodes stamp—men with the world idea—are likely to undertake the huge task of controlling the gold output of the world, and there are such men in America. The "gold mine trust" would of necessity be the brightest and greatest star in the galaxy of syndicates, trusts, combines and mergers.

Concentrates.

ALABANDITE is manganese sulphide—iron black in color. It is rarely met.

WATER POWER under 485 feet head will give about 1 H. P. per miners' inch employed.

E. H. BENJAMIN is secretary of the California Miners' Association, address 331 Pine street, San Francisco, Cal.

LITHOLOGY is the science which treats with rocks as mineral masses, particularly with reference to their microscopic character.

LARGE quantities of pyrrhotite occur in copper and gold mines in California, but these ores, as far as known, carry only traces of nickel.

OXIDIZED ORE containing gold to the value of \$100 per ton or more sometimes affords no visible trace in a pan or bonspoon upon vanning.

If all of the interstitial spaces in a box of well-shaken sand were to be filled with pure cinnabar the ore would carry about 60% of that mineral.

MELONITE (telluride of nickel) was first discovered in the Melonea mine, Calaveras county, Cal.; hence the name. This ore is of rare occurrence.

BATTERY WATER may be heated in mills where steam is used by passing the water through a heater in which the exhaust steam of the engines may be utilized for this purpose.

It is stated that at Cananea, Mexico, copper is produced at an average cost of 6½ cents per pound. This must necessarily vary with changing conditions, both above and below ground.

It is always economy to cover exposed steam pipes whether for long or short distances. Where steam is conducted underground in pipes the necessity is greater for proper covering than elsewhere.

SO FAR as known neither hypersthene or any of the other pyroxenes carry nickel, and volcanic rocks containing rhombic pyroxenes are not a natural habitat for nickel ores, unless the ores occur in veins in these rocks.

In the construction of a quartz mill steel plates placed above the chutes on the inside of the bin will be found to be economical. The plates should be 2 feet wide and 3 feet long at least, and will save the wearing out of the planking of the bin.

TIN and mercury are peculiar in that the oxide ore of the former, casiterite, is found in the deepest portion of tin mines, far below the water line, and that the sulphide of mercury is found in the outcropping rock as well as in the deepest portion of the deposit.

THE Federal law does not permit the building of any submarine structure which shall become a menace to navigation. Tunnels or other conduits passing beneath rivers, lakes or other bodies of navigable water, must be constructed under the bed of such body of water.

THE best method of "killing" powder smoke in underground workings is to have an abundant supply of pure air driven into the mine, under a pressure which will send it to every face and stope. Other methods—spraying with water, etc.—only give partial relief.

THE coarseness of crushing in cyanide operations can only be decided by careful experiment. The fact that your neighbor is able to get high extraction by coarse crushing does not signify that you may be equally successful, though apparently your ore may be similar.

A DISCOVERY may be made anywhere within the boundary lines of a mining claim—that is, the boundaries may be fixed without any reference to the point of discovery; but the law requires that the claim be located in such manner that the vein shall pass along its center.

It has been stated that the occurrence of native quicksilver in a mine is an indication of its approaching exhaustion in depth. It is a fact that the native metal is usually found in the lower portion of an ore shoot, but it does not necessarily follow that a second shoot may not occur in greater depth.

A DOUBLE-CYLINDER hoisting engine, 12x20 inches, running at a speed of 175 revolutions per minute, with a piston speed of 583 feet per minute, and with boiler pressure of 100 pounds and cylinder pressure of forty pounds, will develop 160 H. P. If the speed be increased in the engines the power will be increased.

A MINER in Mariposa county, Cal., who found difficulty in saving gold in panning, because of its being "greasy," mixes ashes with the gold-bearing dirt in an iron tank, and water being added, a fire is built under the tank, heating to the boiling point. The water is drained off and panning then becomes easy, the gold being saved without difficulty.

FLAT BINS for ore are seldom justified, as the ore will never run when the slope has reached less than 35°. After that all of the ore remaining in the bins must be shoveled at a cost varying with the character of the material and the size of the bins. In a flat bin having a capacity of 1000 tons not more than one-half will run to the chutes. All the balance must be shoveled.

A CONTACT VEIN is one occurring between walls of dissimilar character, as limestone and quartzite, or slate and greenstone. Lenticular ore bodies are lens-shaped in form, that is, thickest at the center and thinning out toward the edges. They may be either great or small as to size. The California State Mining Bureau, San

Francisco, Cal., will determine rock specimens from California free of charge.

TO FIND quantity of air required for the complete combustion of one pound of coal of given composition, let the constituent carbon, hydrogen and oxygen be expressed as percentages of the total weight of the coal. To the carbon add three times the weight of the hydrogen, and from the sum deduct four-tenths of the oxygen. Multiply the remainder by 1.52, and the product is the quantity of air at 62° F. in cubic feet required.

THE dust taken from the condensers at furnaces of quicksilver mines contains a large amount of mercury. It is intimately mixed with the black dust or lamp-black. To separate the metal from the dust it is mixed with wood ashes in a shallow trough-like depression in a cement floor and vigorously raked. This causes the minute globules of mercury to unite and flow in a stream to a catchment basin. A high percentage of the mercury is thus removed.

PLATINUM ORE is of somewhat uncertain occurrence, although there are several reports of its discovery. In the State Mining Bureau, San Francisco, Cal., is a rock specimen from New Zealand, which is said to contain platinum. This peculiar and very valuable metal is found in the placers of many countries. It is usually, if not always, associated with gold, due to the high specific gravity of both metals. That platinum does not exist where gold is found is not known to be a fact.

FIFTEEN miners' inches under a head of 50 feet will furnish only 1.8 H. P., and would not supply sufficient power for a 3-stamp mill. When 200 inches or more of water are available under the head sufficient power would be generated to run an electric dynamo, and sufficient power transmitted for the purpose. Unless 200 inches or more of water are available the greater portion of the year, the installation is inadvisable. Any impact wheel will give satisfactory results if properly installed.

THE law of eminent domain is inapplicable to the case of a passage of a private tramway of whatever sort over the lands of another. In respect to the transportation of mine products, it has been held that a mine owner cannot condemn land for a railroad (or other means of transportation) to be used exclusively for the product of his own mine. This rule has been announced by the supreme court of Colorado. The only apparent way to overcome the difficulty is by lease or purchase of a right of way.

"SPAR" generally refers to some variety of feldspar of which there are several. The most important being orthoclase (potash feldspar), which is an important constituent of granite, and plagioclase (lime-soda and soda-lime feldspar). These latter graduate, one into the other, and are essential constituents of many basic and acid eruptive and volcanic rocks. There are also several other kinds of "spar," as calc spar or calcite (carbonate of lime); heavy spar, or barite (sulphate of barium); fluorspar (calcium fluoride), etc.

PROSPECTORS are likely to be deceived in the value of their copper-bearing ores. The percentages of copper contained in the numerous kinds of oxide, carbonate, sulphide and other ores of copper as stated in text-books has reference to pure samples of each sort of mineral and permits of no gangue or other foreign substance being considered. Pure minerals of the copper class do not usually exist in large quantities, but are found disseminated in grains, flakes and veinlets throughout the rock, or only increasing the cracks and cleavage faces.

THE Homestake mine, Lawrence county, South Dakota, was discovered in 1876, developed in a superficial manner by the original locators and sold. What is known as the Homestake really embraces a large number of claims surrounding the original location. The original Homestake Co. assessed stockholders only \$200,000 in four 50-cent assessments, since which time the combined mines have paid millions in dividends. The first Homestake mill contained thirty-five light stamps. The first mill with heavy stamps was the original Homestake Co., built in 1878.

THE diamonds of South Africa are found in a dark basic rock of which olivine is a prominent constituent. The diamonds of Brazil, South America, are found in conglomerate, and in the alluvial resulting from its disintegration. The diamonds of California have only been found in placers, thus far, and no knowledge of their original matrix or gangue has been gained. The ancient river channels in which diamonds are found in California also contain a white micaceous sandstone, slightly flexible (itaacolumite). This peculiar rock also occurs in the diamond fields of Brazil.

GOLD and silver are usually each present in an ore containing either. The method of separating these metals by use of boiling nitric acid has long been known, but at the time of the sixth and twelfth Egyptian dynasties the art of parting the silver from native gold was not known. Some gold leaf of the Persian epoch was pure, the silver having been separated. As, however, there is a period of about twelve centuries between the dates of these two specimens analyzed, specimens of intermediate dates must be examined in order to ascertain the date of this metallurgical discovery.

CALIFORNIA placers have produced a number of nuggets of large size. The largest reported from Placer county weighed eighteen pounds and ten ounces, and was found at Michigan Bluff. Much larger masses have been found in pocket mines than have ever been found in the placers. A notable instance is that in the Bo-

nanza mine at Sonora, Tuolumne county, where a single pocket is reported to have yielded \$360,000, the central mass of which contained more than \$40,000 in gold without gangue. Other large nuggets are reported from Carson hill, in Calaveras county, Cal., but the record is indefinite.

A BOILER may generate steam with great economy, and owing to the steam being wasted by improper application to the work through the engine, the result in work be very unsatisfactory and the boiler blamed unjustly. On the other hand an engine may be very economical in its use of steam, and yet the advantage derived from this source be more than offset by the wasteful operation of the furnace or boiler or both. The efficiency of the steam plant should not be measured by that of either boiler or engine alone. The whole plant from ash pit to exhaust pipe should be taken into consideration.

IRON has been made direct from ore by what is known as the Eames process, natural gas being employed as fuel. In this process the iron ore was pulverized and mixed with ground coke, which had been dipped in clayey water and dried. This mixture is spread on the hearth of a reverberatory furnace when the blast burning natural gas is turned on. The iron becomes intensely hot on the surface of the layer and is collected by workmen who, with iron rods, roll it up in balls much as wet snow is rolled to form snowballs. These balls are placed in a squeezer and form what are known as "blooms." This process forms a high grade of iron. That crude petroleum might be substituted for natural gas in this process seems a rational conclusion.

OIL TANKS that are full never explode, as the oil is not explosive. It is the gas generated by the oil that explodes, and a tank nearly empty containing explosive gas would create a more violent explosion than one nearly filled. All crude oils as well as refined oils used as fuel are dangerous when heated, though some are much more so than others. The relative safety of various oils can be determined by slowly raising the temperature of the oil in a basin or other suitable vessel and applying fire. The temperature at which the gas arising from the heated oil will flash upon the application of fire is called its flashing point. Oils usually flash at a lower temperature when an electric spark is introduced than when a burning stick is applied to it.

URALITE is the technical name of a mineral resulting from the alteration of augite, and is essentially green hornblende, having the appearance, cleavage and optical properties of hornblende. Often the nucleus of the crystal is seen to be unaltered augite, having the characteristic cleavage of augite. When the augite is completely altered the secondary product will usually be mostly chlorite, though some hornblendes may have escaped complete alteration. That the original mineral was augite can then only be surmised by the character of the accompanying feldspars, if they can be determined in a rock so greatly altered. The uralite referred to herein in the issue of Dec. 6, on page 326, is an artificial product made from asbestos and similar fireproof materials and has no connection with the uralite of lithology.

COMPRESSORS can be fitted with automatic controllers which will cause the machine to stop when the air pressure has reached a stated number of pounds per square inch, and to start it up again when the pressure has gone down to a fixed limit. In the hydraulic regulator this is accomplished by the use of two cylinders fitted with pistons, arranged tandem. One piston is subjected to air pressure, the other to water. When the air pressure is greater than the water pressure it forces the water cylinder piston to close the gate on the pipe line, and, the power being cut off, the compressor stops. The air being used in the mine causes the pressure to decrease until the water pressure overcomes it, when the gate is opened and the compressor again starts up. Supplied with a device of this description, a compressor requires little attention.

THE object of the law requiring annual work is, that the holder of a mining claim shall give substantial evidence of his good faith. The labor is not required to be applied in any particular manner, so long as it is unquestionably devoted to the claim. It must not be such as to raise a question as to its purpose. This labor may be in excavating, erection of works for mining and placing machinery. Any building, machinery, roadway or other improvements used in connection with and essential to the practical development of the claim, and having a direct relation to the development of the claim, constitutes assessment work. Picking rock from the walls of a shaft or tunnel, or along the croppings of a ledge in small quantities from day to day, making tests for the purpose of sampling it, breaking and examining it under a glass, crushing it and panning it out and carrying it away and making assays of it in an attempt to find the pay shoot is not such as the law will permit to be claimed as assessment work. The placing upon the ground of machinery, lumber, tools, etc., which are not used, but subsequently removed to another claim for the purpose of doing a similar duty, as assessment work, is a sham and a fraud and will not stand. Assessment work may be done in a tunnel being driven to develop several veins, the owner doing \$100 worth of work for each claim in the group directly benefited by the driving of the tunnel. As the character of the rock varies greatly, the amount of work must be determined by the wages paid in the district or State where the claim is located, a full \$100 worth being required.

Electricity in Mining.

The application of electricity in mining and metallurgy has been given considerable attention in this journal. Electrical advance in mining operations has been made notable in recent years and the most prominent and practical of such advances have been explained and exploited in these columns. In the latest volumes published have appeared the following: In Volume LXXXI were published "Electrical Precipitation of Gold on Amalgamating Copper Plates," page 8; "Electrolytic Production of White Lead," page 35; "Electrolytic Production of Caustic Soda," page 38; "Electrical Conductivity of Aluminum," page 63; "Electric Safety Fuse," page 122; "Electric Geodetic Apparatus," page 130; "Electrically Driven Centrifugal Pumps," page 151; "Electrical Manufacture of Carborundum," pages 213, 218; "Electrical Refining of Gold and Silver," page 215; "Electrolytic Extraction of Zinc," page 251; "Electrolytic Method of Producing Ozone," page 371; "Electrical Underground Concentration," page 371; "Electricity and Magnetism," page 399; "Electrically Operated Dredger," page 431; "Electrical Machinery in South Africa," page 494; "Electrolytic Deposition of Gold," page 504; "Electrolytic Production of Copper," page 530; "Electrical Extraction of Mercury," page 580; "Electrical Generator Applied to Car Truck," page 591. In the same volume may be found many other articles on the same subject illustrated. Among these are "Electric Mine Hoists," page 433; "Electric Mine Locomotives," page 567; "Electric Furnace," pages 123, 219, 282, 375, 438, 494; "Electric Lamp for Miners," page 282; "Electric Power on the Comstock," page 490; "Electric Sinking Pumps," pages 89, 92.

The above are not one-half of the articles regarding electricity in mining and metallurgy that might be enumerated as having appeared in that volume.

Volume LXXXII gives further evidences of the attention given this important subject. Among the practical and technical articles on that subject in Volume LXXXII may be mentioned that on the "Electric Amalgamator," page 126; "Electric Firing of Explosives," page 71; "Electric Furnace," pages 7, 94; "Electric Haulage in Mines," page 259; "Electric Power Generation at Coal Mines," page 209; "Electric Mining Methods in Colorado," page 47; "Electric Ore Concentrator," page 170; "Electric Reduction of Metals Under Water," page 59; "Electric Transmission," pages 2, 70, 112, 145, 199, 209, 259; "Electricity in Mountain Mines," page 241; "Electrolytic Deposition of Gold and Silver," page 126; "Electrolytic Gold Saving in West Australia," page 262; "Electrolytic Recovery of Metals," pages 135, 283; "Electrolytic Refining," pages 61, 84, etc.

In Volume LXXXIII is found further wealth of valuable information on this important subject. From the various articles thereon may be cited "Electric Bell System for Mines," page 270; "Electric Burner for Blast Furnaces," page 214; "Electric Coal Mining Machine," page 184; "Electric Copper Refining," page 109; "Electric Furnaces," pages 90, 165; "Electric Haulage in Tunnels," page 227; "Electric Hoists on the Comstock," page 56; "Electric Mine Locomotive," page 56; "Electric Mining Machine," page 268; "Electric Power in Hidden Treasure Mine, Placer County, Cal.," page 241; "Electric Pumping, Possibilities and Limitations," pages 154, 164, 174; "Electric Smelting Furnace," page 7; "Electric Welding of Pipes," page 220; "Electrical Installation Crown Mountain M. Co., Dahlonega, Ga.," page 45; "Electrical Precipitation of Gold," page 33; "Electrical Reduction of Iron Ores," page 139; "Electrical Transmission Advantages Over Mechanical Transmission," page 268; "Electrical Transmission of Energy of Coal," page 107; "Electrolysis Applied to Reduction and Refining of Copper," page 244; "Electrolytic Apparatus for Treating Metals," page 57; "Electrolytic Process for Refining Lead," page 68; "Electrolytic Apparatus for Extracting Precious Metals," page 111. Did space permit the list might be greatly extended.

For instance the article on electricity in connection with the operation of a gold dredger, written like others especially for this journal, cost over \$100. It will be found with the illustrations (which were drawn and engraved especially for this journal) on pages 183, 194, 204, 216, 228, 242 and 260 of Volume LXXXIII.

The same remarks hold true of Volume LXXXIV, in which are the usual number of specially prepared articles on electricity as applied to mining and metallurgy, showing the intelligent attention bestowed thereon by this journal. "Electrically Operated Mine," pages 169, 176; "Electricity in Mines," page 73; "Electric Mining Locomotives," pages 131, 155; "Electric Motors for Power Drills," page 201; "Electric Powder Thawer," page 258; "Electric Power Plants of the Pacific Coast," pages 330, 334, 355; "Electrical Roasting Furnace," page 294; "Electrical Sluicing of Ore," page 31; "Electrical Triplex Pump," page 245; "Electrically Driven Centrifugal Pumps," page 75; "Electrically Driven

European Mining Plants," page 259; "Electrically Lighted Mine," page 17; "Electricity in Mines," page 73; "Electric Metal Working Apparatus," page 192; "Electro-Metallurgy of Zinc," page 8; "Electrolytic Cyanide Process," page 45; "Electrolytic Deposition of Copper," pages 218, 280; "Electrolytic Production of White Lead," page 17; "Electrolytic Production of Tin," page 260; "Electrolytic Recovery of Copper from Low-Grade Ores," page 161; "Electrolytic Refining of Copper," pages 3, 215.

In the volume which closes with next Saturday's issue will be further found evidence of the importance attached to electricity in mining and metallurgy on the part of the MINING AND SCIENTIFIC PRESS. In this volume (LXXXV), the index of which appears in next week's issue, will be found among others the following: "Electrical Equipment C. & C. Shaft, Virginia, Nevada," pages 111, 115; "Electrical Power for General Purposes in Mining and Milling," pages 293, 307; "Electricity in Connection with Cyanide Process," page 322; "Electrolytic Treatment of Lead," page 264; "Electrolytic Parting of Gold and Silver," page 233; "Electrolytic Treatment of Ores or Slimes," page 91; "Electrolytic Refining of Copper," page 202; "Electrolytic Production of Spongy Lead," page 306; "Electrolysis of Fine Silver," page 3; "Electric Rock Drill," page 320; "Electro-Metallurgical Treatment of Copper Ores," page 208; "Electro Three-Phase Plant at Essen, Germany," page 269; "Electric Smelting Furnace," page 51; "Electrical Precipitation of Gold on Zinc Shavings," page 292; "Electric Power in Rhodesian Mines," page 269; "Electro-Metallurgy," page 185; "Electrolytic Extraction of Copper," page 82; "Electro-Metallurgical Treatment of Zinc Ore," page 25; "Electrical Treatment of Ores," page 193; "Electricity in Mining and Metallurgy," page 112; "Electric Power in Quartz Mining," pages 104, 111, 115; "Electric Power, Cost of," page 217; "Electricity in Mine Operations," page 234, 235; "Electro-Magnetic Gold Extraction Process," page 142; "Electric Furnace," pages 91, 185, 314; "Electricity and Compressed Air in Mining," page 173.

The above is by no means exhaustive. It is merely designed to illustrate one of the departments of mining and metallurgy to which for going on five decades this journal has given deserved attention. In this department of applied electricity as in others it leads in its line, and the above brief citation is deemed sufficient refutation to the recent Eastern assertion that "electricity in mining has been strangely neglected." Perhaps, elsewhere, but not in these columns.

Economical Mining Method Required.

TO THE EDITOR:—Under the heading "An Economical Mining Method Required," my idea would be to proceed as you recommend, but also using filling from the surface if sufficient waste is not made in the mine. Evidently this method would require too much timber for economical working, so I offer a suggestion in the following:

All the levels should be run in the foot wall and raises put up every 30 feet, and these raises connected say every 10 feet with the ore body as the work of stoping proceeds upward. As a rib of ore must be left between successive levels to hold up the waste in the level above, the levels should be say 200 feet apart.

Having in mind that the levels are in the foot wall and not in the ore the first work would be to break into the ore at every 30 feet, with say 4x4-foot holes at a 45° incline and stope the ore up for 15 feet, using stulls to stand on. When this is done continue the raises in the foot wall near the vein and break into the ore body about 5 feet below the top of the stope. Now put in stulls along the stope and make a continuous platform with 2-inch planks, and stope down 10 feet of ore, sort out the waste and let it down below the stulls to fill up space, and the ore shove down the raises into the ore chutes. The timbers are taken out as the work continues upward and used again above, so that no timbers are left in the stope. This to be continued to the surface.

If the waste is not sufficient to keep the stope filled below the stulls a raise could be run to the surface and enough waste quarried and let down the raise to fill this space. Now when all the ore above this level is taken out, the walls where not supported can cave in without doing any damage.

By this time the levels below have been completed, and the same procedure is followed, only instead of taking waste from the surface it can be taken from the stope above.

The details of ventilation, etc., will, I think, offer no great difficulties. ALGERNON DEL MAR.
Pasadena, Cal.

Further contributions to this interesting and practical subject are always in order, as it is through an interchange of ideas that the broadest knowledge is gained. Referring to the above suggestions of Mr. Del Mar, while the method suggested is ingenious it seems that it might prove a more expensive method than the Colorado mine in question can afford. It is further suggested 4 to 6-inch poles be substituted for

2-inch planks in construction of platform in the stope, as blasting or falls of rock after blasting would quickly destroy the planks. The running of filling from a stope above packed with waste into one below requiring filling is a process of extreme danger at times, owing to choking of the chutes or other openings. The run has to be started in such cases by means of powder, and it is the placing of the powder in such manner as to do effective work that makes it dangerous. Filling from the surface is always preferable when material can be obtained at less cost than when the filling is obtained underground. The superintendent must decide for himself in each case what means shall be employed to obtain filling, the cost per ton of ore extracted being his guide.—Ed.

A General Principle of Profit.

Written for the MINING AND SCIENTIFIC PRESS by CHAS. H. FITCH.

There are some things in principle, which, although "plain as a pikestaff" when attention is clearly drawn to them, remain unacted upon and as useless as though they were not true.

One of these is the making of profit in business, and the business in hand to the readers of a mining paper is the mining and treating of ores for the production of metals and merchantable minerals.

Labor produces value, and if it be employed under normal conditions in work that is commercially of value, the more labor the more profit to the manager. In a well-conducted machine shop business a profit of \$200 to \$400 a year is made on the labor of every workman employed. In the mining business this profit per person is much more variable.

Of two enterprises, each managed with about the same skill, the larger is more profitable, both positively and relatively, that is to say, the gain increases out of proportion with increase in size. The conduct of two such businesses in comparison may be likened to the conduction of steam through pipes. A 4-inch pipe carries sixteen times as much heat power as a 1-inch pipe, while it only has, roundly speaking, four times the exposure to loss by radiation. Steam is, therefore, carried with less loss in large pipes, and the saving is good clean profit.

Labor is the profitable thing; it is the measure of all value, and the thrifty use of it is the very first consideration of wise management. There is nothing more profitable than to employ a man provided you can do it under commercial conditions unless it is to employ advertising space in a paper which has a good circulation among buyers.

There are no buts or ifs about these propositions. They are absolute. Every man has in his own labor the nucleus of the best business proposition in the world. Most men think meanly of it, and their labor suffers accordingly, but if a man alive to the fact that his labor is a mine, a treasure and an expandable asset, seeks by all means diligently to improve it; he gets his salary raised. If he has been saving 20% on his previous salary and gets a raise of 20%, prudently continuing his old habits of living, he will increase his savings, and if he were a stock company he would increase his dividends 100%, and that would be an excellent stroke of business.

Brains applied in business always pay. Brains are the kind of intellectual labor which make manual labor more extensive and efficient. If a man by hand work will make a gun in two weeks, and by using his wits as did the elder Whitney, will devise a system and machinery by which 300 men and boys will make 1800 guns in a week the profit is, roundly speaking, not upon the labor of 300 persons as compared with that upon the labor of one person, but it is the profit upon the labor of 3600 persons as compared with the profit upon the labor of one person. We see how the profit upon the employment of labor is multiplied by the profit upon the employment of brains.

Vested rights may pass away or be revised by social law, but by the same natural unrepeatable law which makes labor worthy of its hire, brains are also worthy of their hire, and the partnership must command the approval of every man possessed of hands and brains.

What doth hinder us from making profit on our enterprises? We might as well come right up, blushing, if needs be, for our own shortcomings, to confront the unblushing fact that the lack of profit in our enterprises is due to lack of brains in ourselves.

And wherein have we not brains? We may have a good growth of hair on our heads, and intelligence enough under it to button on our clothes, order a meal at a restaurant, and do other useful ordinary things, but when we seek to enlarge the profits of our unsatisfactory business the fact we come up against hard is that we do not know how, and we have not force and enterprise enough to try to know how. Like the father whose boy said he was a Baptist, but that he was not working at it, we have brains, but they are not applied in our business.

We keep doing. Goethe said: "It is hard to think,

and easy to do." We do, therefore, what is easiest, and least profitable.

There have recently been made some interesting comparisons between the tin mines of Dolcoath and Mount Bischoff. Dolcoath is not prospering as it should. It has some disadvantages of outworn system, some "lord's fees" and other exactions of private and local taxation, but after all the chief thing developed by the comparison is that Mount Bischoff does and knows how to do more than Dolcoath. It appears that Mount Bischoff brains are more active, able to reach out and do more, able not only to mine tin, but to smelt it, and to smelt it not only for themselves, but for other concerns that do not know how to smelt.

The Dolcoath people give away the smelting part of the business, wit, thought and experience are not enlarged with enterprise to cover that. But they are looking at the Mount Bischoff dividends and are thinking of going to the Antipodes to learn the smelting business.

In a wider and more comprehensive use of brains, in knowing how to do more and doing it the profits lie. Of course some people attempt to do things by imitation which is the cause of most failures in metallurgical work. It comes too dear to think, so other people's thoughts are appropriated, and the substitution is not successful. The monkey with a bottle imitating the professor with a telescope got only a sousing of unpleasant fluid in his face and eyes. Shortness of applied thought is another name for shortness of profits in many cases. If we pay other people to think for us it frequently costs too dear, and if we try to steal other people's thoughts ready made, it is likely to be a bad fit.

Yet the acquisition of knowledge and the mental labor of mastering a subject are very profitable. They are not easy. The inertia which opposes start and progress in this effort hangs like lead upon many mining enterprises, and its lethargic influence benumbs the minds of many young men whose future but for this shortcoming might expand like an aurora borealis.

Nor do we have to go to Wales and Tasmania for examples. It may be worth while for our own miners to take thought on something, rather than to leave the thought and the profit to others. But the idea is not enough. In the course of my acquaintance with mining affairs nothing is more noticeable than the failure of small smelting works. In going over years of sales of small smelting furnaces, it is of little use to keep after the same companies for supplies needed by a live going concern. The names are changed. The works are no longer active. The postoffices are discontinued.

It is evident that the working out of a successful proposition of this kind to meet the conditions with the ways and means at hand implies much more than the suggestion of thought. It implies hard, thorough and correct thought, with a painstaking study of fact. But thought which is thought and not mere superficial smattering and gaudy assumption remains the richest of all investments.

A Single Engine Hoist.

The accompanying illustration will give a comprehensive idea of the Freeman single engine hoist. It

A Single Cylinder Hoist.

is built for mining where operations are conducted on a moderate scale, though this engine has demonstrated its ability to hoist a 700-pound load 230 feet in forty-five seconds. One of the features of this engine is the device for throwing the engine off "dead center." It is arranged to work on the inside of the rim of the flywheel and operated by means of a lever, and does away with the necessity of having to shut off steam and run around to ride the "bull wheel" every time the engine stops on center. An air valve is so placed that air can be admitted to the steam

cylinder after shutting off steam, making it convenient for lowering men without depending wholly on the brake. Power is transmitted from the engine to the hoisting reel by means of a paper friction, the shaft of the reel working in eccentric bearings. The entire machine takes a floor space 5x5 feet. It is manufactured by the Freeman Foundry & Machine Works, Joplin, Mo.

A Dry Process for the Treatment of Complex Sulphide Ores.*

NUMBER II—CONCLUDED.

By H. L. SULMAN and H. K. PICARD.

We may point out that gold also escapes under such conditions, and it was in regard to the recovery of this metal from zinc precipitates obtained from the cyanide process that we were led to devise a method for obviating such losses. Indeed, the success of this method induced us to further apply the same principles to the treatment of complex sulphide ores. Our idea was, therefore, to treat these primarily as zinc rather than as lead ores, and to obviate the difficulties so encountered when the material is so considered.

It is necessary to draw particular attention to the rule invariably adhered to in zinc smelting, viz., to employ nothing but anthracite as mixing coal, it being supposed that the gases resulting from the carbonization of other classes of fuel causes losses in spelter. Moreover, other fuels are (reasonably) considered likely to lead to the slagging of retorts during distillation, a danger to be avoided as far as possible. Even good (roasted) blende ores always contain much slag material (Fe_2O_3 , FeS , SiO_2 , etc.), whose baneful influence it is sought to reduce to a minimum by the addition of a very large excess of coal over and above that required for reduction purposes, such excess acting as a mechanical diluent. As the amount of mixing coal used in general practice varies from 50% to 100% (on the roasted ore), it is essential that this should contain the least possible ash. Further, slagging troubles would be far more pronounced if ordinary zinc distillation of roasted Broken Hill ore was attempted; as, apart from the lead and ferrous sulphides, we have also the maganous oxide, which yields a very fluid slag with silica, and much garnet. As the result, however, of our experience in the distillation of zinc-gold material, we formed the opinion that the use of a strongly coking coal would, by holding dangerous materials suspended in its pores, overcome the objections to the presence of lead and other slag formers and permit of the distillation of complex blende-galena ores as ordinary spelter-yielding material. In this factor alone has lain our main departure from previous methods, and extended practical trials have proved our anticipations correct. It is unnecessary here to further trace our progressive trials, and we now consider the completed process.

It commences with the usual preliminary roast of the crushed ore, slimes or zinc-lead concentrates in a reverberatory furnace to a product which shall contain, preferably, not more than 3% of total residual sulphur.

The roasted ore is next mixed with only 20% of crushed coking coal and the mixture briquetted in any suitable type of machine. As a binding agent, pitch or other carbonaceous material is added; lime or other chemical binders are undesirable, as they tend to permeate the whole briquette with slagging material, and also, from some unexplained reason, to cause lead losses. Further, the admixture of a carbonaceous bond aids the bituminous coal in forming the coherent coke, which not only the distillation but the subsequent lead smelting operations demand. The briquetting plant is of a standard type, consisting of a disintegrator, into which the roasted ore, coking coal and pitch are introduced, a pug mill, press and table, together with the usual intermediate elevators and a conveyor belt for delivering the finished briquettes to the retort house.

The briquettes are then submitted to distillation in an ordinary zinc retort furnace. Those used by us at the Emu Works in South Wales are of the old-fashioned hand-fired Welsh-Belgian pattern, without regenerators, and using hand-made pots. Each contains 144 retorts in six rows, the lowest being cannon pots; a retort takes about fifteen briquettes, the total capacity of a furnace being seven tons.

This type of furnace is, nevertheless, not the most suitable for our requirements, as six rows of retorts one above the other can not be uniformly heated by bottom firing. The lower row of cannons is apt to be damaged by excessive heat if the uppermost rows are to receive an adequate temperature; too sharp a heat is also detrimental to the best extraction. In most spelter works employing this type of furnace the difficulty is avoided by using the lower rows for the distillation of "hard" material (roasted blende), while the upper are employed for "soft" (calamine) ores. On uniform material such as we treat a compromise must be effected; we therefore work to ob-

tain the best results from the three intermediate rows. These give us a 70% zinc recovery on a 26% briquetted ore, while the lower and upper rows yield a few per cent less.

For these reasons the gas-fired three-row type of furnace has been adopted for our process at Cockle Creek, as it permits of absolute uniformity of heating, and, therefore, of the maximum recovery. Hydraulic-pressed retorts, so universally used on the Continent and in America, are also employed in Australia. In ordinary zinc smelting practice the roasted ore and anthracite duff are hand-mixed in front of each furnace, the damped powder being then charged into the retort; by our method the mixing is more efficiently performed in the briquetting plant, and the charging of the briquettes more easily effected by means of a shaped iron paddle.

Once charged, the procedure for the recovery of the zinc is identical with ordinary practice, although the action within the retort is of a different character. The briquettes, as they reach the temperature of distillation of coal, coke into coherent masses, with evolution of volatile hydrocarbons. Reduction of the lead simultaneously occurs, the minute metallic particles entirely permeating, and being held up in the pores of the coke; while at the higher temperature shortly afterwards reached, zinc oxide is reduced, and yields metallic zinc vapors, which are condensed in pipes; these are tapped at intervals in the ordinary way. The distillation occupies the normal time.

We draw attention to the remarkable fact first noticed at the outset of our experiments, now confirmed by some years' experience, that, whereas in ordinary practice lead distills to a marked extent in zinc vapors, in our process the whole of the lead, as also the silver and gold, is retained by the coke. The latter thus appears to exert an actual physical retardation of the volatility of lead in a slow current of zinc vapor. So definite is this advantage, that we find the spelter thus produced from Broken Hill ores to be of exceptional purity, averaging 99% of metallic zinc and commanding prices equal to that of the best brands produced from lead-free ores. This spelter is already in considerable demand, owing to its low lead tenor, which does not often exceed $\frac{1}{2}\%$; it can thus be employed for the manufacture of the finer kinds of brass for which the ordinary brands containing from 1% to $2\frac{1}{2}\%$ of lead are useless.

The zinc having been recovered, the seconds are withdrawn from the pots (pipes and luting clay having been removed and sweeps collected) and discharged into the caves, whence in usual practice they would be dumped. But the seconds resulting from the treatment of such complex sulphide ores still retain the major values, in the shape of all the lead and silver originally present. These are obtained in the coked briquettes in a form eminently adapted for recovery in the subsequent lead smelt. The zinc retained in the seconds does not exceed the amount allowable in ordinary practice and presents no difficulty in obtaining of the usual bullion recoveries. The residual carbon in the seconds is, of course, a considerable source of heat in the after smelt and it therefore is not lost as it is in the case of ordinary zinc seconds.

By this simple operation we are enabled to convert a complex ore into a simple silver-lead product, amenable to normal reduction methods, having already recovered the bulk of the hitherto objectionable zinc as high quality spelter. The final operation for the recovery of lead and silver as base bullion being the ordinary one, conducted in the usual types of plant, both in South Wales and Australia, does not call for further description here.

Indeed, we may remark that the few operations which constitute our process are all effected in well known and standard types of plant; and that no fresh item of apparatus, concerning which there might be doubt as to costs or method of working, has been found necessary. Roasting, briquetting, zinc-distilling and lead-smelting methods and costs are fully known. Throughout the operations, nothing beyond coal and binding agent and the usual lead-smelting fluxes are employed. It is somewhat surprising that so simple a method of treatment has been so long overlooked. The system is compact and permits of economies when zinc and lead-smelting processes are thus linked together, not realizable by either separately.

In general, blende ores containing less than 40% of zinc are not profitable to treat. Such if mixed with 80% of anthracite duff would yield pot material containing little more than 22% of zinc; whereas a zinc-lead concentrate, containing say 35% of zinc, requires, by our process, the addition of only 25% of mixing coal and binding material and produces a briquette carrying 28% of zinc, with the additional advantage of yielding a residue containing profitable material. It is possible to treat a 35% concentrate for its zinc alone, the lead and silver remaining in the residues as profits subject only to recovery costs; while the fuel values remaining aid in reducing these.

RECOVERIES.—Lead, silver and gold, as before stated, are recovered in the seconds in full; the lead, of course, is subject to the normal smelting losses, just as in the treatment of ordinary lead concentrates; though the Huntingdon and Heberlein and Carmichael processes claim to reduce such losses to

*Transactions of the Institution of Mining and Metallurgy.

about 2%; and we believe these claims to be well founded.

Bearing in mind the fact that the seconds hold all the lead in the metallic condition, the question naturally arose as to whether smelting was the most economical method of recovering this metal and the silver. We devoted considerable attention to the mechanical separation of the reduced lead, but unsuccessfully. The metallic particles and prills are so exceedingly finely divided throughout the carbonaceous sponge that any method of water dressing or concentration results in heavy loss; nor did oil concentration give any better results, owing to the excessive amount of carbon also taken up. On the whole, smelting was adopted as the simplest, safest and most usual method.

With regard to zinc recovery, the spelter yields are practically the same as those obtained in the ordinary treatment of blende ores. To reckon in percentages is somewhat illusory, as these depend naturally upon the original zinc contents of the ores treated. With a zinc-lead product carrying 40% of zinc no difficulty is experienced in obtaining a recovery of 80% of that amount, while, with a 25% material, 70% may safely be reckoned upon in modern furnaces. Late advices from Cockle creek inform us that the recoveries of both lead and silver in the seconds are complete, and that the zinc production already exceeds 70%, slimes averaging 25% of zinc being the raw material used. With 35% material we have every reason to anticipate an 80% recovery. The pot consumption is quite normal there; mixing coal is obtainable at lower rates than are available to us in South Wales. Fireclay of good quality for the manufacture of hydraulic pressed retorts is also available on the spot; and we have used trial lots of this material for some of our retorts in South Wales, with excellent results. The works at Cockle creek are the first producers of spelter yet installed in Australia.

In ordinary zinc practice, it is not found economical to force the extraction below a certain point, as the increased time required not only reduces the output of the furnace, but, with the higher temperature necessary, the pot consumption becomes unduly great. The zinc usually left in the seconds varies from about 5% to 8%. Our working costs are also normal; no difficulty is experienced in calcining the complex ores to the sulphur standard usually required for blende; the zinc furnaces do not demand any greater attention or further hands, while labor in retort charging and discharging is materially lightened by the use of briquetted material. Briquetting charges are, of course, additional; but are to some extent balanced by the far smaller consumption of mixing coal, and by the economical handling of material during the final lead smelt.

A point to which attention will doubtless be directed is that of pot and pipe consumption. The average life of our pots, even though used for distilling such highly refractory material, is fully equal to that of the retorts used for good blende and calamine ores according to usual methods, being from five to six weeks each. Our present consumption per day is 3.7 pots per furnace. The cost of our hand-made pots is about 6s apiece. This is admittedly high, even for England, and hydraulic pressed retorts, having a longer life, requiring less clay, and demanding a lesser distillation temperature, can be produced for 3s each.

A certain proportion of "fines" is inevitably produced in raking the briquette seconds from the pots into the caves beneath the furnace house. These are separated, damped with water, and rebriquetted for lead smelting purposes from time to time at a cost of about 2s per ton of fines.

We append a schedule of cost incurred during the late treatment of a parcel of Broken Hill slimes, averaging 25% of zinc, 24% of lead and 26 ounces of silver per ton.

CALCINING.—Hand roasting of such material to 3% of total sulphur or slightly under in South Wales costs about 9s per ton, while mechanical roasting in the Godfrey furnace amounts to about 6s 6d. Other forms of mechanical calciners, such as the Brown straight line, will roast complex sulphide ores to this limit at even lower cost; but at present the hand calciner and the Godfrey appear to yield the denser product and also to be preferable in other respects. The question of the best form of calciner is not fully settled, but we select the Godfrey costs as those most lately obtained.

	163	11½
Less costs.....	71	1
Realizations.....	£4	12 10½

From which must be deducted cost of transport of slimes or cost per ton of ore.

In regard to the first four items the above costs are certainly capable of reduction.

In South Wales we have at present no lead-smelting plant for spot recovery of the seconds values, but dispose of these to local reduction works according to their assay values upon the usual scale of returning charges. The erection of lead-smelting plant at our own works is under consideration, in order to save these extraneous profits and to obviate freight to the smelters. In Australia the smelting plant is that in ordinary use for reduction of the lead concentrates, etc.

The work outlined has occupied our attention for some years past, during which we have carried

complete in all cases, while the spelter yields have varied from 60% to 80%, according to the original zinc contents.

Complex ores containing copper present no further difficulties as to retort treatment; the copper, of course, remains with the lead and silver in the seconds and is thence obtainable by modern copper-lead smelting methods.

Summarizing our process, it may be said to consist in the holding up of the minute particles and prills of reduced silver-lead in a coherent but still highly porous coke or carbonaceous sponge during zinc distillation, thus preserving the retorts from contact with lead or other slag material and insuring the all but complete non-volatility of the lead and silver in the liberated vapors of metallic zinc.

In spite of its apparent simplicity, our process has been found capable of complete patent protection in the principal countries and colonies of the world, while the grant to the United States, German and Scandinavian patents may be taken as evidence of novelty.

Principal Telluride Minerals.

Calaverite, 56%. Gold, 44%. Hardness, 2½; color, bronze yellow.
Hessite, 37%. Silver, 63%. Hardness, 2½ to 3; color, steel gray.
Coloradoite, 38%. Mercury, 62%. Hardness, 3; color, iron black.
Tetradymite, 48%. Bismuth, 52%. Hardness, 1½ to 2; color, pale steel gray.
Melonite, 76%. Nickel, 24%. Hardness, 3; color, reddish white.
Sylvanite, 56%. Gold, 28%. Silver, 16%. Hardness, 1½ to 2; color, silver white.
Pezite, 33%. Gold, 25%. Silver, 42%. Hardness, 2½ to 3; color, iron gray.
Altaite, 38%. Lead, 62%. Hardness, 3; color, tin white.
Nagyagite, 32%. Lead, 54%. Gold, 9%. Hardness, 1 to 1½; color, lead gray.
A mineral scratched by a finger nail has a hardness of about 2; one which is cut by a knife is about 5½ in the scale of hardness.

An Ore Concentrating Plant.

The illustration on this page is of a concentrating plant as erected and running in the Llewellyn Iron Works, Main and Redondo streets, Los Angeles, Cal. The plant consists of one 6-foot four-roller Elspass centrifugal quartz mill, two amalgamating tables with silver plated copper plates, one 11x8-inch Blake crusher, one belt-driven ore feeder feeding Elspass mill, one 8-inch belt elevator carrying crushed ore from crusher to feeder, two new Standard concentrators, all driven by an 8x10-inch automatic cut-off engine.

The primary object in erecting this plant was for exhibition purposes. The secondary object is its use

A Concentration Testing Works.

through a large number of experiments in the laboratory, in small works specially erected in Surrey, and finally at the Emu works in South Wales, where large scale furnaces have been running for the past year as a commercial undertaking. We have there treated over 4000 tons of Broken Hill slimes besides many other parcels of complex sulphide ores. The recoveries of lead and silver have been practically

as a custom concentrating mill for testing ores, and where the Llewellyn Co. can treat ores shipped to them to determine the values contained, or the adaptability of the ores to a treatment by concentration. Parties interested in mining and in the concentrating of ores, and those contemplating the installation of a concentrating mill are invited by the Llewellyn Co. to call and see this plant in operation.

Mine Timbering in the Old Ironsides and Knob Hill Mines.

By H. P. DE PENCIER, McGill University, Montreal.

The old Ironsides and Knob Hill mines are situated at Phoenix, in the Boundary Creek district in British Columbia, at the watershed of the Kettle river; superintendent, W. Y. Williams.

The ore bodies in these mines are very large, which fact necessitates an extensive and thorough system of timbering the lower levels of these mines. The boundaries of these ore bodies have not yet been well ascertained; the ore appears to extend over 2000 feet in length, while the width is not determined, though crosscuts from the foot wall have been run for upwards of 300 feet.

The Old Ironsides has been prospected and developed by a system of shafts and drifts, showing the ore to extend down 400 feet, though work is not being carried on below the 300-foot level. Stopping ground on the 200-foot and 300-foot levels has been opened up, exposing blocks of ore running as high as 280 feet in width by 200 feet long; also, in an intermediate level—the 250 foot—ground 160x40 feet has been blocked out and is being stoped.

The Knob Hill is worked through a long adit tunnel, along which three blocks of ore 200 feet square are blocked out on at least three sides. On the surface, 150 feet above the level of this tunnel, an open cut or quarry is operated, and delivers ore to the tram system in the tunnel by means of shafts or chutes in the solid rock.

The foregoing brief description of these mines is merely intended to convey some idea of the immense size of the ore bodies, and hence the need for timbering when the ore is removed.

The ore in this mineralized zone does not form a very strong rock, though where (as in the Knob Hill) there is not much water and it has not been shattered it forms a fairly safe roof for drifts and crosscuts.

A large part of the timber used at both mines has been obtained on the claims, the country here being rather heavily wooded. The principal kinds of wood are pine, spruce, tamarac and Douglas fir; the three latter are regarded as of nearly equal value, the fir being the strongest and all three being stronger than the pine, which, however, has the advantage of being softer and crushing more easily, so as to take up the load more evenly; for this reason pine is much used for making wedges.

Most of the timber on the claims has now been used and the supply for the future is being brought in by railway from outside points.

Posts and caps are cut from round timber, which has the bark peeled off to lessen the decay caused by moisture retained on the surface and below the bark when it is left on; this round timber is 10 inches and upwards in diameter, the posts being generally 15 inches up to 24 inches in diameter, while caps are smaller, the thickness across the flats at the post being 9 inches. Lagging poles are 5 to 10 inches in diameter.

Sawed timber is used in the construction of ore bins, hoists, and in the lining of shafts and chutes.

On the surface at both mines considerable timber has been used to build retaining walls to hold second-grade ore and for making ground about the shafts and buildings. Round timber with the bark on is used for this; it is built into a wall by means of cross-pieces, forming cribs; these pieces are notched to fit the notches cut in the logs of the wall, and are run back into the bank, where the weight of material resting against them holds the whole crib firmly in place.

Both mines are equipped with ore bins capable of holding from 5000 to 10,000 tons and intended for the storage of ore and its easy delivery from the mine to the railway cars. The foundation is made of 12-inch square timber made into bents and resting on mud-sills of the same timber; these rest on the solid rock.

The bents run crosswise of the bin at a distance of 5 feet from center to center and are strongly braced, the direction of the braces being changed in successive bents, while the bents are tied together by braces crossing three bents.

The floor of the bin comes directly on top of the bents; it is flat and horizontal; the ore takes the angle necessary for its removal.

The floor and sides of the bin proper are made of 4-inch plank, spiked solidly to the 12-inch square timber frame; 1-inch iron tie rods are freely used in addition. Along the front side of the bin a railway track is built, and above this on the bin a platform extends, from which the cars are loaded by means of a series of chutes placed 5 feet apart from center to center. The gate is made of heavy iron 26 inches wide, and is pivoted on an axle and opened by a long iron lever; two movable planks above the iron gate permit the attendant to bar out large rocks if they should stick in the mouth of the chute.

Above the main bin compartment proper the grizzlies and breaking and sorting platforms are built. The grizzlies are made of 25-pound mine rails cut to the desired length and strung, bottom upwards, on

iron rods at each end; pieces of pipe placed between on the rods make the desired space between them—about 2½ inches. There are two such grizzlies, each 5 feet wide, with an open space between them, in each 15 feet of the length of the bin. This open space is used for dumping ore directly into bin when it does not require sorting or breaking; or, by means of a chute, a low-grade ore can be thrown out of bin at the back.

Above the grizzlies is the tram car level; the cars come from the shafts to the center of the bins and turn either way on a steel turnplate and are run to the desired compartment and dumped. A beam 4 inches square, running parallel to the track, about 2 feet from it, prevents the cars being overturned into the bin.

The whole structure is roofed with 1-inch boards to keep out rain and snow, which are abundant in this locality. The bin is a small one, with a capacity of about 18,000 cubic feet, if full, or, say, 1000 tons. There are in addition two others of much greater capacity.

The shafts in operation on the Old Ironsides are the original prospecting shafts and the "gallows-frames" are not elaborate. It is built of 12-inch square fir timber. Men and timber are taken on the cage at the shop floor level, while ore or waste is hoisted to the tram floor level to be taken to the ore bin or waste dump. As the hoisting engine is quite small, an elaborate hoisting frame is not required. The frame at No. 2 shaft is similar.

Both shafts have two compartments, one being for hoisting ore, etc., and the other for ladders, pipes, etc. Owing to the fact that they are lagged inside with 2-inch plank, I have not got full details of the timber in them.

Shaft No. 1 is cribbed for a part of the way down, after the method of framing timber for cribbing which is employed in British Columbia; it is a halved joint combined with a heveled hitch on the inside to resist lateral pressure; it is improved if side and end plates are made to break joints so as to prevent one set slipping over the next.

The lower part of No. 1 shaft and all of No. 2 shaft is timbered with square shaft sets, with a halved joint and beveled hitch, and the posts resting at top and bottom in a hitch to prevent them being forced inwards. The center girt or divider is supported by a tenon and mortice joint; and center posts are provided. The lagging in bad ground is placed as usual outside of the timber and is supported on strips spiked to the plates; in safer ground the lagging is placed on the inside, being intended to prevent small rocks from falling in.

As the shafts are only prospecting ones, the level stations are simple. Posts about 15 feet long are put in the shaft at the station, and the upper end wall plates are run across the station a distance of about 20 feet, with suitable supporting posts and dividers or cap pieces; the lower end plates are also extended to form part of the sills for carrying the floor and steel turntable plates.

Both mines are equipped with a track system. The rails are carried on wooden ties placed about 18 inches apart; these ties are flat on two sides and are 3x4 inches and 30 inches long.

The main haulage roads are lighted with incandescent lights; the wires are carried on small round timbers about 4 inches thick, wedged across the top of the drifts like a horizontal stull. Where there are tunnel or stope sets, they are used to carry the wires.

The method of mining the ore in the Old Ironsides may be briefly said to be overhand stoping. The stopes thus formed are filled with square sets of timber, and this timbering constitutes the most important item in the timbering of the mine.

The square sets are of round timber 8 feet in height placed 5 feet apart, with cap pieces to hold them in their relative positions laterally. These posts and caps are securely wedged into place, to carry any pressure resulting from settling or breaking loose of rock. They are all round timbers, except the bottom sills in each stope which are 6x12-inch sawed timber. The sketches at the top of the accompanying figure show the method of framing joints; in the sketch square timber is shown, for convenience in drawing. The lower drawing shows a number of sets put together; in it the posts are represented as being too small to allow of cutting the small shoulder for catching up the whole cap. This occurs sometimes with the round timber.

It will be noted that the framing of this timber is especially designed to carry vertical pressures—the tenon on the end of the posts insuring the position of the posts in the different floors of the stopes being directly above the corresponding post in the floor below.

It will also be noted that this system of timbering is very elastic and can be applied to ore deposits of almost any shape and size.

This timber is all framed on the surface by special carpenters. The framing platform is situated in a convenient place above the shafts and below a spur of the railway, from which the timber can be unloaded and rolled direct onto the platform, framed and rolled off onto piles near the shafts.

It is cut up into caps and posts to the best advantage. Templates, straight edges and squares, are used by the framing carpenters. All timber should be marked off and measured from a center line. It may be mentioned that this method is about to be abandoned at this time and the timber framed by machinery.

The timber is transported to the shafts on a 30-inch gauge track and lowered into the mine by the "muckers" of the night shift, and stored in convenient places near the shaft stations. In this connection it may be noted that it is advisable to store it in as dry a place as possible, as the drier and lighter it is the more easily and expeditiously the heavy pieces can be handled.

From the stores underground the men of the day timber crew take it as required to the various parts of the mine on small timber trucks running on the ordinary mine tracks.

If the timber is being put in on the bottom of the stope, the first operation is to get the 6x12-inch sill accurately in place. This may be done by the engineer giving level and location with his instrument, or it may be placed by reference to the adjacent timber, if there is any, by leveling and measuring across from the sills. When the sill is tamped accurately to its true position, the sill posts are set in position in the open mortices in the sill, then the caps are put on and the whole is "spragged," or braced, and wedged securely in place. It is usual to brace and wedge caps and posts from the adjacent walls, and the roof also in the case of the caps by a large vertical sprag set on top of the caps meeting at a post.

Next the lagging of round poles is laid on top of the caps; the lagging poles are from 4 to 10 inches in diameter, 10 feet long, and have the bark left on. Not more than four square sets of lagging are laid in the same direction, i. e., a square 10 feet on the side; the adjacent lagging is laid at right angles to this to give a better support to the ends.

If the timber is to be used on floors above the track level, it must be hoisted from the level; to do this chutes are built through the lower floors; they are made either of plank spiked to the lagging or of lagging, the top being spiked to the cap and the bottom ends resting on the next floor behind the caps, so as to be out of the way of the timber being hoisted.

The hoisting engine used in handling timbers is driven by compressed air from the mine mains. This engine is in common use in British Columbia for this purpose. It is made in two sizes with double cylinders, 5 and 6 inches in diameter, and drums 12x21 inches and 14x24 inches respectively. The 5-inch engine is said to be capable of lifting 1400 pounds 100 feet per minute. The pistons are of the trunk type, there being no crosshead or slides; the crank discs are carried on the small shaft at the top; this shaft is geared to the larger shaft, on which the drum is loose, and is connected by a V friction between the drum and the large gear when running. This engine is mounted on mine car wheels, for transportation underground, and braced securely to walls and timber when used. Each engine should be equipped with air hose, wrench and oil can.

(TO BE CONTINUED.)

Square Set Timbering, Ironsides Mine, Phoenix, B. C.

A Study of Amalgamation Methods, With the Object of Avoiding the Loss of Mercury.*

By MICHAEL BUSTAMANTE, JR., M. E., City of Mexico.

I. GOLD AMALGAMATION.—In 1890 I was manager of a mining enterprise in the State of Michoacan. The ores were composed principally of iron pyrites (much decomposed), in a quartz matrix, with native gold in irregular grains. Some portions, however, carried their metallic value in a matrix of calcite and siderite. The mill in which the ores were treated consisted of two 800-pound stamps, two amalgamating plates, four pans, two automatic washers, two Frue vanners, and the necessary accessories for assaying, retorting and refining gold. The plant, originally erected with American capital, and directed by competent Americans, passed in 1890 into the hands of Mexican owners. On taking charge of the business I found on hand a large amount of ore assaying 35 grams of gold per metric ton (about one ounce Troy per ton of 2000 pounds); but the company was losing money, and was about to abandon the business.

Obviously, the difficulty lay in the treatment of the ore. The extraction of gold scarcely reached one-tenth of the assay value; the loss of mercury was considerable; and high freight charges excluded the alternative of exporting the ores.

The situation suggested that amalgamation was not applicable to these ores, and that a more appropriate method must be adopted.

The cyanide and chlorination methods had been tried without practically satisfactory results. For the first few months I employed a combined system, extracting a part of the gold by direct amalgamation and cyaniding the concentrates. This saved 32% of the assay value, but the cost of milling still exceeded the proceeds. Meanwhile I observed that on certain occasions during the amalgamation there was a very perceptible escape of hydrogen sulphide. This I could not satisfactorily explain; but, on the other hand, it accounted for the great loss of mercury which had made amalgamation so expensive and ineffective.

To remedy this (and also diminish the great quantity of cyanide of potassium that had to be used, especially when the gangue of the mineral was calcite), I began with a reverberatory roasting of the crude ore delivered to the mill, and a subsequent washing with water, until the latter came off perfectly clear. The operations of amalgamation, concentration and cyaniding were then performed as before, and the result a gold extraction of 63% of the assay value, with a loss of 11% of the mercury used.

This loss surprised me; nevertheless, under these conditions the milling of the ores began to be remunerative. On further investigation, the gold which had escaped amalgamation was found to be in a peculiar state of aggregation, reminding one of its tendency to condense some gases, provoking reaction and decomposition of the "platinum sponge." I think that the gold could be found there in another form also, analogous to so-called "black platinum."

Once this fact was discovered, the explanation of the previous phenomena was not difficult. The very finely divided sponge and black gold, coming into contact with the mercury, provoked an energetic electro-chemical action; and this decomposed a relatively large quantity of water, the oxygen of which was absorbed by the sponge, while the hydrogen, combining with the sulphur of the pyrite, produced hydrogen sulphide. Of the latter, a part escaped as fire gas, and a part attacked the mercury, producing mercury sulphide, which explains the great loss of that metal.

Of course the actual reactions are much more complicated than this rough statement; but the principal result, the formation of mercury sulphide, has been conclusively proved by analysis. The loss of the gold is also explained, whenever the sponge or black gold are present under such conditions as to operate like electro-positive element of an electric couple; that is to say, it will receive, condense and hold oxygen, and it will be returned by the electro-negative element of the couple in question.

The investigation was continued to find a method of treatment which would both reduce the loss of mercury and increase the extraction of gold. Since the gold occurred in the gangue in grains of varying size, sometimes, but not always, impalpable, it seemed impossible to dispense with amalgamation entirely. On the other hand, a subsequent cyaniding was impaired by the pulverizing with stamps, which gave a large amount of slimes, through which it was difficult to pass the cyanide solutions. Moreover, these solutions were immediately transformed into carbonates and ammonia salts, and the consumption of cyanide was excessive. Treatment with chlorine was also difficult, and by neither of the two methods was I able, in my laboratory experiments, to obtain more than 40% of the assay value.

I resolved, therefore, to continue experimentally the amalgamation, supplemented at first with cyanid-

ing, and prefaced with roasting, as above described. Having abundance of hydraulic power, I began the use, with certain modifications, of the Siemens & Halske method of precipitating the gold. This increased by 15% of the assay value the extraction of gold, and also reduced the expense of treatment. Precipitation with zinc was therefore abandoned. The increased extraction was undoubtedly occasioned by the employment of the electric current, since the treatment had not been otherwise modified, and the average composition of the ores had not changed. A comparative experiment, in which a given lot of concentrates was cyanided, and one part was treated with zinc precipitation, and the other with the electric current instead, entirely confirmed this hypothesis. In the first place 60%, and in the second 66.30% of the assay value was obtained.

Before devising a process of my own, I tried those of Body (1894), B. C. Moloy (1894), and others, without satisfactory results. Finally, after some experiment and change in my apparatus, I perfected a method by which the loss of mercury was reduced to 0.03%, and the extraction of gold brought up to 95%

amalgamating plates 2 decimeters square, and on the side walls of the huckets similar plates 0.5 meter square, united, in tension with the poles of the dynamo, in such a manner that the electro-motive power would not exceed 1.5 volt. Later, the aggregate surface of the plates was enlarged to some 15 meters square, which gave the best results. A further increase of surface would have been useless.

On an average, nine tons of ore were treated every twenty-four hours; the extraction of gold was 94%, and the loss of mercury was insignificant.

Still later experiments led to the abandonment of the preliminary roasting of the ore; and this resulted in the maximum gold extraction of 95% of the assay value.

(TO BE CONTINUED.)

Making Dump Room.

Where shafts are located on flat ground dumping room is often a matter of importance. This is obtained in various ways. Often the head frame is constructed on top of a firmly built sub-structure,

Orinoco Shaft, Leadville, Colo.

of the assay value, while the cost of treatment was lowered until it only amounted to \$0.42 per ton for crushing, and \$0.19 for amalgamation and the electric current.

At first, this method consisted in reverberatory roasting of the ore and washing abundantly with water, then passing it through the mortars, where it was pulverized and began to amalgamate. The mortars were provided with interior amalgamating plates, in communication with the poles of a dynamo that produced a current of 150 amperes, 14 volts. The two stamp batteries discharged into a common channel, in which, side by side, were placed the large amalgamating plates, one communicating with the positive pole, the other with the negative. This arrangement gave encouraging results; but in view

the waste being filled in around it. The accompanying illustration of the Orinoco shaft, at the foot of Harrison avenue, Leadville, Colo., shows the manner of securing dumping ground at that mine. The material is carried to a high point in the head frame from which it is run out on an elevated tramway. The lower portion of the head frame is inclosed with corrugated iron, forming rooms in which are located the blacksmiths' and carpenters' shops.

The Bon Air Shaft.

One of the noted shafts of Leadville, Colo., is the Bon Air, an illustration of which appears on this page. The Bon Air has always been a wet shaft,

Bon Air Shaft, Leadville, Colo.

of the energetic decomposition of the water which attended it, the electro-motive power was diminished by subdividing the amalgamation plates and uniting them, not in series, but in tension. This produced the much desired result. The liberation of gases diminished considerably, and the loss of mercury became insignificant.

Similar dispositions were made for the pans and the washers. Over the wooden shoes were placed

and several years ago attracted unusual attention by caving, at which time tons upon tons of bales of hay were dropped into the shaft for the purpose of stopping the cave. This was finally accomplished and the loose ground caught up. The large areas of ground stoped in some portions of the Leadville district has long since made surface improvements appear insecure, notably on Fryer hill, but the Bon Air seems not to have suffered in this respect.

*Transactions Am. Inst. Min. Eng.

Mining and Metallurgical Patents.

Patents Issued December 9, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

PROCESS OF REFINING LEAD AND ZINC FUME.—No. 715,238; F. L. Bartlett, Canyon City, Colo.

A process of refining zinc and lead fume, consisting of subjecting collected mass or body of fume at low red heat to action of products of combustion of carbonaceous fuel, stirring fume while subject to action, withdrawing it from action into suitable receptacle, allowing it to cool slowly, finally separating outer layer of fume from body of mass.

FURNACE FOR SMELTING IRON.—No. 715,269; H. A. Jones, New York, N. Y.

Combination with blast furnace having crucible for molten metal, flaring fusion chamber above crucible, cylindrical chamber above fusion chamber and of smaller diameter than upper part of fusion chamber, series of equally spaced vertical recesses in furnace wall, series of deoxidizing ore retorts in recesses, means for covering same, receiving hoppers containing deoxidized ore beneath retorts, supply hoppers connected to receiving hoppers, valves between receiving and supply hoppers, tubes extending upward from supply hoppers, through which devices may be inserted to insure proper discharge of deoxidized ore from supply hoppers, passages from supply hopper to upper part of fusion chamber, valves in passages, platforms around furnace and means for operating aforesaid valves, means for visually observing interior of deoxidizing retorts.

TUNNEL ROOF.—No. 715,406; J. C. Meem, Brooklyn, N. Y.

A roof or shield for tunnels, comprising plurality of arched compression members composed of I-beams

suitably spaced apart, superposed arch members, chord stiffeners associated with compression members, assembling bands encircling arch members and having terminals disposed beneath chord stiffeners, and tension device associated with terminals.

STEAM SHOVEL.—No. 715,470; F. Franz, Wallace, Idaho.

An excavating apparatus comprising frame, motor arranged adjacent to one end thereof, haul mechanism located adjacent to motor, conveyor passing at inclination upward from base of frame and over haul mechanism and motor, boom mounted on frame adjacent to receiving end of conveyor, shovel carried on boom, and connections between shovel and haul device.

METHOD OF DRYING AIR FOR BLAST FURNACES.—No. 715,366; J. Gayley, Pittsburg, Pa.

A method of drying air for blast furnace use, which consists in precipitating greater portion of moisture therefrom by refrigerating air to zero centigrade, eliminating remainder of moisture from air by bringing cold air into contact with material having affinity for water.

CENTRIFUGAL MILL.—No. 715,473; O. Gaiser, Kempton, Germany.

In a centrifugal mill, combination with annular bed, journal located above annular bed and concentric therewith, and means for rotating journal, of relatively long shaft flexible throughout length and formed of spiral spring, mill-roll upon the end of flexible shaft, arranged to travel over and in frictional contact with annular bed when journal is rotated and automatically leave annular bed when journal ceases to rotate.

ORE CONCENTRATOR.—No. 715,328; G. E. Woodbury, San Francisco, Cal.

In ore concentrating table, working surface composed of grooves running longitudinally to table, standing strips dividing principal portion of grooved surface into number of sections, that portion of surface between concentrates discharging end of table and ends of standing strips having grooves of less depth than remaining portion of surface, means for imparting vibratory motion to table.

AMALGAMATOR.—No. 715,538; W. F. Bedell, Kaslo, Canada.

An amalgamator, comprising tank for containing mercury and having in bottom central cone provided with outlets for escape of water and sand, outlets leading from sides of cone through bottom of tank, hollow shaft stepped in cone, and hollow reaction arms extending from lower end of shaft downwardly to lower portion of tank and having lower ends extending horizontally.

BLAST FURNACE.—No. 715,519; R. C. Steese and E. L. Ford, Youngstown, Ohio.

In a blast furnace, combination of tank having overflow, series of valved openings arranged along under side of tank, series of pipes having inlet ends submerged in water contained in tank and opposite ends projecting into next adjacent pipes of series, pipe extending from blast furnace and having discharge end projecting into first pipe of series, and gutter arranged under tank and inclined, discharge tank being so arranged that material discharged into gutter from tank will be removed by overflow water.

APPARATUS FOR OBTAINING METALS BY ELECTROLYSIS.—No. 715,626; G. Taddei, Turin, Italy.

An apparatus having electrolyzing vessel or bath, heater under same, chlorinating vessel, heater under same, pipe connecting upper part of bath with lower part of chlorinating vessel, substituting vessel, pipe connecting upper part of chlorinating vessel with substituting vessel, pipe for carrying gas from last named vessel.

Mining Summary.

Specialty compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Hubbard, Elliot and Treat have located several veins of copper ore on Elliott creek, in the Kotsina country. On one copper glance is found which also carries silver, and others show bornite. Last year there were twenty-two claims on Elliott creek; this year has raised the total to fifty-four, all within a radius of 5 miles. The source of Elliott creek is about 18 miles from Copper river and 130 miles from Valdez.

The Aurora G. M. Co., of Kenia peninsula, is doing development work with machine drills. A mill of 100 tons daily capacity is being installed with a water power plant. B. Stevens is manager.

It is reported that the Alaska Development Co., composed of Indiana and Puget Sound men, have bonded 70,000 acres of Alaska lands to an English syndicate for a large sum, based on an agreement that the syndicate shall spend \$50,000 a year in development. The chief apparent value of these lands lies in the striking of a gusher 60 miles south of Valdez and 10 miles east of Copper river.

ARIZONA.

COCHISE COUNTY.

Superintendent E. R. West of the Easter Sunday mine, says he has seven four-horse teams hauling ore from the mine to Lowell for shipment.

The Marquette & Arizona M. Co. is incorporated by Michigan men to operate a group of claims in the Warren district near the Calumet & Arizona Co. and the South Bisbee properties.

The Miner reports forty-three claims in the Copper and Montezuma canyons, Huachuca mountains, near Bisbee, including the New York group, California and Arizona, McDowell and Gerdes group, two groups of G. Baron's, the group of A. Chedals, A. Beauchamp and Champagne's group, sold to S. Mitchell and Young, representing Michigan men. G. Baron is superintendent. Machinery will be installed and a smelter is proposed.

The new engine on the two-compartment shaft at the Bisbee West, near Bisbee, was started up last week. Manager Dwight says stringers of ore are being encountered in the shaft. Sinking will be continued till the main ore body is cut, and stations will be put in at every 100 feet.

The Modern mine, near Bisbee, in the face of the drift, 200 level, is in 160 feet. The miners broke into ore that assays 5% copper and \$15 gold. The rock carries native copper, copper glance and red oxide. Sinking has been delayed on account of water, but will be resumed as soon as pumps can be installed.

The Bisbee Miner says work on the Easter Sunday mine is suspended pending the arrival of hoisting machinery.

GILA COUNTY.

The Globe-Boston C. M. Co., developing the Mallory group near Globe, has let a contract to J. Glasston to sink the 200-foot double-compartment shaft 250 feet, from which point levels and crosscuts will be run.

The Silver Belt reports an increased flow of water in the Gray mine of the United Globe, near Globe. The water was struck in the seventh level, but is yet within the capacity of the pump.

The Silver Belt reports a heavy flow of water in the ninth level of the Old Dominion mine, the pump at the twelfth level being submerged. Three auxiliary pumps and two bailing tanks (each 800 gallons capacity) discharging a total of 2000 gallons per minute are holding the water from rising above the eleventh level. Two additional boilers and two pumps are being installed, making seven boilers to operate pumps and hoists. At the smelter two furnaces are still running, the ore coming mostly from stock piles at the mine, with the briquetting machine supplying a small portion.

MARICOPA COUNTY.

J. S. Witherlay, general manager of the Socorro G. M. Co., west of Wickenburg, says the 20-stamp mill is completed, but will not be run till the cyanide plant is finished. Fifty men are employed.

MOHAVE COUNTY.

Superintendent J. Detar has men at work on the Queen Bee mine at Mineral Park. The company has ordered a hoisting plant and as soon as it is installed sinking will begin below the 200 level. Drifts are being run south from the 180 level and north from the 125 level.

The Franconia M. Co. is preparing to work its properties in the Chemehuevi district.

Superintendent McNulty has several

men doing assessment work on his turquoise claims, near Mineral Park.

PIMA COUNTY.

The Producer group, near Quijotoa, is reported sold to the Producer M. & M. Co. for \$10,000. This group comprises nine claims in the Quijotoa district, 50 miles south of Casa Grande. There are 3000 feet of work in shafts, drifts and open cuts. A drift from the 100-foot level of the shaft on the Producer claim crosscuts a vein 11 feet in width, which carries gold, silver and copper, an average of \$15 to the ton. The camp will be known as Brownell, being named after the original promoter. A hoist and pump will be put in. F. Brownell is superintendent.

SANTA CRUZ COUNTY.

Mining is resumed on the gold prospects of the Hays Con. M., M. & L. Co., near the property of the Eureka M. Co., in the Uncle Sam district, near Nogales.

YAVAPAI COUNTY.

Parties working the Bodie mine under bond have made the first payment of the \$20,000 purchase price and have men building a wagon road to Palace Station. Val Verde has 100 men at work. The smelter runs on 5% coke.

Superintendent Monaghan, of the Home Run mine at Groom Creek, near Prescott, will put up a 10-stamp mill.

The Courier says the Poland mill, near Prescott, is in operation. Ore has been struck in the upper tunnel of the Poland Extension. Superintendent Pickrell at the President mine, has twenty men at work, and sinking from the 500-level to the 600.

The three mills on the Mudhole mine at Walker are running night and day, crushing 100 tons of ore a day.

The Val Minto M. Co. has bought the Brown ranch and water right. They have ordered 7000 feet of pipe and a 10-stamp mill. The property is in Mint valley, 12 miles northwest of Prescott.

Three furnaces are in blast at the smelter of the United Verde Copper Co. at Jerome, and others will be blown in as soon as expedient. The portions of the mine where the fire is located are bulkheaded from other workings, and carbonic acid gas, made from coke at the surface, is being blown into the mine to extinguish the fire.

CALIFORNIA.

AMADOR COUNTY.

C. D. Lane is investigating the claims owned by T. Orr, half a mile north of Plymouth. The principal outcrop is a white quartz vein, 3 feet wide, situated in the bed of Indian creek. The rock prospects well. A number of holes have been sunk on this and the adjoining property, owned by T. Boyson.

Superintendent Hampton of the Oneida mine, near Jackson, says he will sink the shaft 200 feet deeper. It is now down 2050 feet. Forty stamps are dropping in the mill.

Another strike of rich rock is reported in the Central Eureka mine, near Sutter Creek. The vein averages about \$8 per ton, but occasionally the workings discover places in the vein where a great deal of gold is visible. This is characteristic of the mines of this portion of the lode.

The shaft at the South Eureka mine, near Sutter Creek, is down 2370 feet and drifting is in progress north and south on the 2300 level. The 20-stamp mill is idle pending development of the lower level. J. Truscott is superintendent.

CALAVERAS COUNTY.

(Special Correspondence).—The Gwin Mine Dev. Co. has declared dividend No. 40 of 15 cents per share, \$15,000, payable December 16. This mine has paid during 1902, \$155,000. Total to date, \$426,500. Gwin Mine, Dec. 15.

(Special Correspondence).—Superintendent Hoffman, the Melones M. Co., is putting air pipes in the main tunnel preparatory to breaking ore on that level. Sixty stamps are dropping. The cyanide plant for treating the vanner concentrates is in operation. Melones, Dec. 16.

The Tom Smith mine on O'Neal's creek, near Sheep Ranch, is being opened by Mr. Harris. This mine is locally considered to be an extension of the Sheep Ranch vein.

Work is being pushed at the Foot & Thompson mine, near Rich Gulch. Teams are hauling pipe and machinery to the ground. It is proposed to hydraulic the surface of the vein the full length of the claim.

Near Mokelumne Hill, Superintendent C. Gall, of the Mead Ranch mine, has started a tunnel on the Mokelumne river slope of the property in the Gold Leaf claim. The tunnel will be 2300 feet long, and is expected to cut several veins that run through the Mead Ranch, as well as the Foot & Thompson and Ilex veins, at

depths of 400 to 600 feet, and will bottom the gravel channel of the Mead.

The new mill at the Fannie Marie, near Mokelumne Hill, is finished and the stamps dropping. At the Bluejay, another property of the company, work is progressing. F. Courtmarsh, of Mokelumne Hill, is manager.

EL DORADO COUNTY.

The Rio Vista G. & S. M. Co., in Fairplay district, is preparing for development work of its property, the Consummes Copper mine.

The Montezuma mine at Nashville is producing good ore. The mine is paying.

KERN COUNTY.

(Special Correspondence).—After years of waiting the people of this section are gratified to see work commence on the long proposed crosscut tunnel on the Southern Cross property near Havilah. This tunnel was begun thirty years ago, run 250 feet, and given up for lack of funds. The present operators, The Southern Cross Con. M. & T. Co., are cleaning out the old tunnel and propose to drive 3000 feet, their objective point being "Rand Hill," from which millions have been taken at shallow depths. The tunnel will have backs of about 1400 feet. In going this distance the Tunnel Co. will crosscut three large ledges at depths varying from 300 to 1500 feet. These ledges are gold bearing and from 20 to 100 feet wide. Before reaching them the tunnel will pass through a large stratum of limestone, which follows the mineralized zone on the east for miles and which appears to have a beneficial effect on the mineralization of the vein when in contact with it. Havilah, Cal., Dec. 13.

LOS ANGELES COUNTY.

The Erkenbrecher syndicate of Los Angeles has bought 4000 acres of land 12 miles west of Santa Monica and north of the Malibu ranch. The district lies a mile or more from the ocean. Oil seepages, oil sands and gas blowouts are found. The company expects to have a rig on the ground within ten days and drilling begun.

MADERA COUNTY.

The copper mines at Dalton comprising four claims owned by S. C. Olinger, have been bought by the Jesse Bell M. & M. Co. of Los Angeles, Cal. There are several shafts 40 to 60 feet deep, all showing ore. The deposits are 30 feet wide. New hoisting machinery will be put in. S. H. Baker is superintendent. These mines are peculiar in that the ore is in a state of semi-oxidation and frequently, shortly after exposure to the atmosphere, the ore absorbs oxygen so rapidly that it spontaneously ignites. The country rock in which the ore bodies are found is chiastolite schist.

MARIPOSA COUNTY.

The mines of the Mariposa Commercial & M. Co. are operating by steam, the dam on the Merced river at Bagby having been swept out by high water.

NEVADA COUNTY.

The Eureka Crown M. Co. of Minneapolis, Minn., has bought the Beckman Hill Diggings, in Pleasant valley, near Nevada City, comprising 160 acres of gravel claims, with several quartz ledges running through them. An incline will be driven to strike the channel, and then drifts run. In the spring machinery and appliances for handling the gravel will be placed on the property and the company will also develop its quartz ledges. W. W. Turney is manager.

Superintendent Foote, at the North Star mine, near Grass Valley, is building a new slime plant. The ore, after concentration, will be sized and reground in a Griffin mill and then pass over the slime plant. Some concrete work has been done and an asphaltum floor put in the mill.

A company has been formed of Utah and California capitalists to reopen the Polar Star mine of Park City, Utah; J. A. Kirby, president. The property includes 240 acres near the North Star mine.

PLUMAS COUNTY.

C. R. Thompson, superintendent of the Elizabeth mine, on Rush creek, near Quincy, says the mill has been closed down for the winter and will not resume until the tunnel is completed. The lower tunnel is in 180 feet, with 240 feet to drive to reach the main ledge, which will be tapped 200 feet deep. This ledge will be followed 750 feet to reach the shoot found in the Lewis tunnel above.

The Bulletin says C. R. Thompson, J. M. Engle and others have located on a limestone ledge from Rush creek through the mountain to the North Fork, 3 miles. The width of the deposit is 500 feet, and can be quarried.

Superintendent E. B. Kimball has six men at work at the Halsted mine on Rich gulch, near Quincy, blocking out ore. He is putting in an assaying outfit. He has, looking forward to this, located 3000

inches of the water of Indian creek at a point above Shoo Fly, and a ditch is being cut, the water to be conveyed 4 miles and used to develop electric power to be transmitted to the mine.

SAN BERNARDINO COUNTY.

The Mohave G. M. Co. are putting in air drills at the Leland mine, near Needles. They are employing forty men.

The Gold Bronze mill at Vanderbilt has been repaired and is again in operation.

SAN DIEGO COUNTY.

The Yuha oil well near Julian is down 885 feet. Last week gas was struck which raised the tools in the well 25 feet.

SANTA CLARA COUNTY.

The Orchard Oil Co., boring a well near Los Gatos, struck the third pocket of gas last week and the pressure threw the drill from the well. The well is 1300 feet deep.

Work has been resumed on the oil wells at Moody Gulch and shipments are being made.

SHASTA COUNTY.

Fifteen miners are at work on the Shasta King mine of the Trinity Copper Co., near Kennet. Development work is being done.

An undivided third interest in the Bald Eagle, Black Bear, Mabel No. 1 and Mark Master quartz claims, in Pittsburg mining district, has been sold to J. Gilardy of DeLamar.

At 2000 feet in their tunnel on the south fork of Clear creek, near Igo, the South Fork M. & D. Co. has cut the ore body. The company is composed of Boston, Mass., men. Superintendent Rogers has had twenty miners at work for a year in driving the tunnel, which, it is believed, has tapped the ore body.

SIERRA COUNTY.

Superintendent F. R. Reynolds, at the True Fissue mine, near Gold Lake, has ceased work on the tunnel for the season, but will resume in the spring.

TRINITY COUNTY.

(Special Correspondence).—The long adit tunnel, known as tunnel No. 2, at the Dorleska mine, near Trinity Center, was completed by connection with the third level of the shaft workings December 4. The distance from the mouth of the tunnel to the shaft is 1315 feet, and the connection was made 1126 feet in the tunnel and 189 feet from the shaft. Work was commenced on this tunnel Sept. 1, 1901, and has been continued uninterruptedly until completed. It is of sufficient size to admit a mule to haul cars and will be used for discharging ore and for drainage. Its average depth from the surface is 200 feet. A strong snowshed 650 feet long has been completed between the mouth of the tunnel and the mill, so that ore from the stopes can be discharged in the mill without reference to the depth of snow, which is great in this section in winter. Supplies and provisions have been got in for the season and the mine and mill will be worked throughout the winter. Upon the completion of the long tunnel work was resumed in the shaft and a fourth level will be run at a depth of 300 feet. The mill has been running steadily since last June on ore of high average value. Fifty men have been employed during the open season and twenty-five will be employed through the winter. The Union Con. G. M. Co. of Los Angeles, Cal., are owners; H. Z. Osborne, president and general manager; M. H. MacIlwaine, superintendent.

Trinity Center, Dec. 18.

The Chloride-Bailey mines produced \$13,500 during November with twenty stamps. The mine is showing improvement with development.

The Morrison & Carlock mine in Quartz valley is in pay and works forty men. The mine is down 380 feet.

Superintendent H. W. Turner has begun work again in the Cherry Hill mine, at Cherry creek, having been placed in possession by proceedings in court.

TUOLUMNE COUNTY.

A body of pay gravel is reported at the Woodside placer on Table mountain, near Columbia, in the eastern tributary which leads into the main channel. Two inclines have been made, 350 feet each, but main channel has not yet been struck. Mr. Woodside is superintendent. At present the work is being done with a horse whim.

W. Wax of Columbia has bought a one-fourth interest in the Haskell placer northwest of Columbia.

At the Enos & Bowen mine, parallel to the Densmore, northwest of Columbia, their tunnel is in 210 feet and they are breaking ore.

Superintendent K. C. Parrish started the New Era M. Co. mill, near Carters, last week, twenty stamps in all.

Superintendent J. F. Parks says 160 tons of machinery have arrived at the Kennedy mine, near Jackson, for the hoisting plant at the new shaft. The hoist will have a capacity of 1000 tons per

per day. The new shaft is down 2600 feet and the old inclined shafts on the vein are at the 2300-foot level. With the mill under construction there will be 100 stamps.

The Nixon placer M. Co. is operating the Richards ranch on Sutter creek. The company owns a mile of gravel channel along the creek. G. F. Cluff of Sutter Creek is president.

The Sonora Banner says the Jumper Gold Syndicate, Ltd., at Stent, has made application to the Superior Court to be dissolved as a corporation under the laws of this State. Jan. 16 has been set for hearing the petition.

Surveyor Donaldson and party have left Carters to survey for a lume to the Lost Fox mine, south of Carters. It will be 7 miles long. Ten stamps of the mill are running. Forty men are employed under Superintendent Engols.

The tunnel on the Lady Washington near Carters is in 200 feet. Machine drills are used.

At the Sullivan mine, south of the Black Oak, near Soulsbyville, the shaft is 200 feet deep.

The night shift has been laid off at the Cllo, near Jacksonville, the day shift being able to get out ore necessary to keep the mill going. Sinking is to be resumed after Jan. 1st.

VENTURA COUNTY.

The Sespe Canyon Oil Co. of Los Angeles, operating in the NW. 1/4 of Sec. 26, T. 5 N., R. 20 W., S. B. M., struck oil at 650 feet. The oil raised 350 feet in the well. It is 15° or 16° gravity. The well has been capped, to be opened in the spring. This is the fourth well to be struck in the Devil's Gate petroleum and brownstone district.

The Sespe brownstone quarry has closed for the winter.

The Bakersfield & Ventura Railroad Co. has 15 miles more of surveying through the Sespe canyon.

Cinnabar has been discovered near Sespe Hot Springs by Mr. McDonald.

YUBA COUNTY.

At the Government works on barrier No. 1 at Daguerre Point on the Yuha river, a double row of piling has been driven that reaches almost across the river. A quarry is being opened.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—The Wellington Oil & Gas Co. at Boulder have a contract with the Boulder Gas Works to supply crude oil for making gas. This was one of the first discoveries in the district. It has never been shot, but is pumped daily. The oil sand is 68 feet thick.

The Boulder Oil Refining & Pipe Line Co. of Boulder has organized to erect a refinery in the district. It will soon be built, the site having been selected.

The Wellington G. M. & M. Co. of Boulder, operating at Gold Hill, are preparing for development work. The main shaft with a drift 25 feet cuts the ore body at a depth of 200 feet. A crosscut tunnel, now in 250 feet, will in the next 100 feet cut the ore opened in the shaft. Ore averages \$30 per ton. The company contemplates a pyritic smelter. The mine can be operated by tunnels to a depth of 1000 feet.

The Crawford Oil Co. at Boulder have everything in readiness to start drilling well No. 2. At well No. 1 they are pumping.

Boulder, Dec. 13.

The Boulder Illuminating Oil Co. shot its well at Boulder last week, and is now pumping. The well is 2500 feet deep and was filled with oil for 1900 feet. Nitroglycerine was put in and exploded at 2000 feet and an increased flow was started.

At Rowena, on his 1000-foot contract on the tunnel on the Sancha group, F. Patterson has driven 550 feet.—The Rosalie, in Sunshine gulch, is being worked by S. Coffman, owner, and is showing sylvanite.—The White Chief Co. is having work done on its White Chief, T. P. Peale and other claims.

CLEAR CREEK COUNTY.

The Big Mediterranean and Gladstone groups in Cherokee gulch, near Idaho City, are reported sold to the Arizona M. & Dev. Co., with headquarters at Oklahoma.

Assays of ore from the west drift in the Gomez mine, near Idaho Springs, show 18-inch shoot of copper-iron sulphide on the foot wall to carry \$56.34 in gold and silver.—Superintendent B. Owen says he will install a compressor and hoisting machinery on the Teller, near Lamartine. It is the intention to resume sinking and drifting on the ore body.—A boiler and an engine have arrived for the Morning Star property. Owen & Morgan are the operators. The engine is 8x24 double cylinder, and the boiler 80 H. P.

The Memphis & Idaho G. M. Co. has bought a group of fourteen claims on Sea-

ton mountain, between the Sun and Moon and the Gem mines, near Idaho Springs. The veins will be opened at a depth of 800 feet by driving the Tropic tunnel 1000 feet ahead. The breast of the Tropic is now in 978 feet. The company has also secured the Bodices.

The Humboldt M. & T. Co. is organized to take over the Humboldt group on Ute creek, near Idaho Springs. The claims are Humboldt, Humboldt No. 2, Chicago, Emma J and Clara J. There is a 10-stamp mill on the ground which will be enlarged; F. C. Smith, manager, and K. E. Seaman, superintendent.

The Diamond Joe Reynolds mine, near Lawson, is shipping ore from the tunnel, which is in 3000 feet, with 100 feet farther to drive to connect with the ninth level.

—The Marshall-Russell M. Co. has discontinued its water power and has installed a boiler.—The Commodore M. Co. has bought a part of Red Elephant mountain and is grading for the machinery.—The Bellvue-Hudson property will resume and let a contract to sink the shaft 100 feet deeper to connect with the tunnel, which is in 1200 feet.

The upraise connecting the tunnel with the Comet shaft, near Georgetown, has broken through and ventilation is established. Manager Baldwin says developments will be made eastward.

Superintendent B. F. Kelly says that in November, in driving the Kelly tunnel, in Democrat mountain, near Georgetown, 260 feet were made through granite with twenty-six men.

CHAFFEE COUNTY.

Near Granite, the Pacific M. & M. Co.'s shaft on its Gopher claim is down 100 feet in ore. An additional 100 feet will be sunk. The vein is 9 feet wide, with 18 inches of smelting ore. A shipment of this latter showed \$59 per ton. The company has a 5-stamp mill on the property. A cyanide plant will be added. H. T. McCauley of Colorado Springs is secretary.

CUSTER COUNTY.

G. Raymond, superintendent of the Custer County G. M. Co., is putting up a hoist at the Toledo, near Florence.

EL PASO COUNTY.

(Special Correspondence).—The Colorado and Standard plants of the United States R. & S. Co., at Colorado City, are handling 800 tons of ore from the Cripple Creek district per day. The report that this company will build a large plant here is not confirmed by the management, though improvements are talked of.

The C. C. & C. C. Sampling & Ore Testing Works, J. C. Hames manager, at Colorado City, is running full capacity; have made several gold bricks, weighing 100 ounces, running 900 to 981 fine.

The Portland mill, at Colorado Springs, has been running irregularly the past month owing to lack of oil.

Colorado City, Dec. 12.

FREMONT COUNTY.

The well of the Fraser Oil & Gas Co., at Florence, is pumping 100 barrels per day. A new oil field close to Canyon City is to be prospected. J. L. Cooper of Canyon City has secured an option on the B. F. McCumber farm, 4 miles east of that place, and will prospect for oil.

The tunnel being driven on the Combination of the Florence M., M. & S. Co., at Florence, which is intended to cut the Summit and Nebraska claims, is in 200 feet.

The tunnel being driven by Hendershot & Nelson on the Lucille, near Florence, to tap the Victoria vein, is in 200 feet. At the 120-foot point a vein of ore was cut which gave returns of 420 ounces silver and some copper.

At the Wisconsin, Barry & Burnett have driven a tunnel 200 feet and have opened a body of lead and zinc ore.

GILPIN COUNTY.

H. C. Bolsinger is sinking on the True Democracy lode in Nevada district, and at a depth of 200 feet cut lead ore 6 inches wide. He is driving the 120-foot level.

Superintendent W. Richards of the Nevada Con. M. Co. has resumed operations at its King and Lamberson & Warren properties in the Nevada district, near Central City. In the upper levels of the King stoping has begun. The shaft will be sunk down 400 feet deeper. At the Lamberson drifting and stoping is in progress. President T. Marks of Denver says the company intends to erect a concentrating plant in the spring.

Manhire Bros., lessees on the Kemp-Calhoun mine, at the head of Leavenworth gulch, near Central City, have the shaft down 300 feet, showing 3-foot vein, with 10 to 12 inches smelting ore.

GRAND COUNTY.

(Special Correspondence).—The Bennett claims on the north fork of Grand river, near Lulu, has two tunnels, 165 feet and 125 feet. Some good values have been found, in silver and lead. The vein is 20 to

60 feet in width; runs from \$10 to \$25 per ton. In early days ore was shipped 75 miles by wagon to rail, but values were insufficient.

The Rollstone mine in Baker gulch will tunnel to cut the Grand Lake vein 500 feet deep. Tunnel will be 500 feet long. In an old tunnel several veins were cut with values from three to 400 ounces silver.

Lulu, Dec. 12.

GUNNISON COUNTY.

The main shaft on the Whig mine in Jones gulch, near Gunnison, is down 240 feet. The Pitkin Gold Belt M. Co., operating the property, is shipping ore running \$100 in gold. Near the Whig, in the same belt, the Williams lode, operated by W. Scott of Pitkin, is showing ore.

It is reported the Revenue group of nine claims in Box Canyon district, between Ohio City and Wapinita Hot Springs, will resume. A road to the mine is being built. The shaft is showing 7 feet of shipping ore and sinking will be continued.

The Old Lot mine at Spencer is shipping ore. The Davenport & Adair tunnel at Duhois is showing large veins of low-grade ore. The Headlight M. Co. is sinking the Poorman and Headlight shafts in Spencer district. Both shafts are down 100 feet. At Vulcan the Good Hope mine sends two cars of twenty tons each weekly to the smelters of ore running \$300 in gold. The shaft on the Good Hope is down 500 feet.

HINSDALE COUNTY.

A strike is reported in the Bonhomme mine, in Burrows park, near Lake City, owned and operated by the Scantic G. M. Co. of St. Louis, Mo. The vein has been cut at 1620 feet from the mouth of the tunnel and has been crosscut 50 feet.

JEFFERSON COUNTY.

It is reported that the smelter at Golden will be closed on account of trouble in getting lime rock. The company owns quarries north of town, but had roads have made it impossible to get enough lime to the smelter to keep it going. Manager Carpenter intends building a railroad 4 miles in length to the quarries.

LAKE COUNTY.

W. A. Miles, of Cleveland, Ohio, has bought the G. & C. S. Co. plant at Leadville. Mr. Miles expects to treat 500 tons daily. Two years ago this smelter, which is a pyritic plant, was closed and has been in possession of the United States marshal. Recently the stockholders held a meeting and ratified a proposition for a sale.

It is reported that Mr. Miles will organize a new company and expend \$250,000 in putting the plant in shape.

MESA COUNTY.

At the Debeque oil fields drilling on the first well of the Stateline Oil Co. has been resumed. The well was 100 feet deep; and will be continued at the rate of 100 feet a day. G. W. Bartholomew is in charge of the Stateline Co.'s work and that of three other companies owning 30,000 acres of land contiguous to the Debeque fields.

PARK COUNTY.

The Red Cross M. Co., J. A. Shinn of Leadville manager, has mining property in Buckskin gulch, near Alma, and is doing development work. Shinn says the formation of the country's lime and quartzite, with the porphyry on top; the ore is found under the lime, resting on quartzite. From the different holes the average assays run \$25. The ore is lead and zinc carrying gold and silver.

It is reported from Tarryall that several new locations have been made and other properties reopened along Tarryall gulch. The Silver Heels T. Co., operating on Mount Silver Heels, have opened pay ore, and so has the Oregon M. & S. Co., at the head of the gulch. This company is planning to put up a mill in the spring.—The Wolverine M. & M. Co., operating on Mineral Ranch hill, have found pay ore in their tunnel.

SAGUACHE COUNTY.

On Cechetopa creek, near Cechetopa, the Colorado M. Con. Co. is pushing work on the Standard and Sterling lodes. A 200-foot shaft is being sunk on the vein in the 1000-foot tunnel.

SAN JUAN COUNTY.

The Kendrick & Gelder Smelting Co. is driving development with electric drills on the Henrietta, Prospect hasin, near Silverton. In the breast of No. 7 level, over 400 feet below the other deepest workings of the mine, there are 5 feet of smelting ore. The ore bodies in Nos. 1, 2 and 3 levels, higher up, with a large tonnage of ore opened, are held in reserve awaiting the connection with No. 7 level, which is in 1700 feet.

SUMMIT COUNTY.

T. Brown, working the Sallie Barber on Mount Baldy, has closed the property for the winter. He says he has opened up a

21-foot vein with a paystreak 18 inches wide. The ore averages in values, gold and silver \$15, iron 20% and a little lead.

Clydo & Etzler at the June Bug on Gibson hill are sinking a winze back 50 feet from the breast of the tunnel where the ore shoot is located.

The Juventa of the Augusta M. Co. has closed down indefinitely.

The Gold Cord M. & S. Co. proposes to work its New Lexington group. The contractors driving the Gold Cord tunnel at Kokomo expect to cut the Champen vein soon. At the West Dove Nest mine ore was cut at 100 feet in the shaft and a contract for drifting let.

TELLER COUNTY.

(Special Correspondence).—The El Paso Con. G. M. Co. of Colorado Springs, operating on the west slope of Beacon hill, Cripple Creek district, has completed a new plant of machinery at a cost of \$100,000, and have completed a new shaft from the bottom of the mine 600 feet to the surface, it being the largest in the district. The shaft is 5x7 feet in the clear, three compartments. The hoisting engines are duplicates of those at Stratton's Independence. The old shaft was too far south. The production of the property has been twenty-five tons or less per day, from which the new equipment and the purchase price of adjoining territory (\$50,000) and running expenses of the mine has been paid the past nine months. Beginning with December the output will be doubled. The property is virgin from the 600-foot level to the surface. The most of the network of veins which traverse this property, which have been opened at the lowest level, have had little ore taken from them.

The Elkhorn, Mary McKinney and El Paso mines in Cripple Creek district have agreed to start a drainage tunnel which will be about 4000 feet long to the El Paso mine, cutting over 255 feet below the Standard tunnel. It is expected to complete it in twelve to eighteen months.

Cripple Creek, Dec. 13.

T. Johnson et al., stockholders of the Theresa G. M. Co., have filed suit against J. T. Milliken et al. and the Theresa G. M. Co., asking that the four years' lease recently granted to Secretary L. E. Hill of the Golden Cycle Co. be annulled; that an injunction be issued restraining him from work on the property, and that defendants pay the indebtedness on the Theresa property, amounting to \$40,000. Plaintiff also asks for an accounting on all ore taken by defendants from the Theresa ground. In the complaint it is alleged that, after ascertaining that the rich veins on the Golden Cycle Co.'s ground extended into Theresa ground, the officers of the Golden Cycle Co. bought a control from A. E. Colburn, former president of the Theresa Co., October 1, 1902, and after securing the resignation of the officers of the Theresa Co., elected themselves and have ever since been operating the Theresa claim for their own gain. The complaint also states that under the Hill lease stockholders are paid a totally inadequate royalty of 15%, and that the officers, in violation with the agreement of A. E. Colburn, have repeatedly refused to pay the Theresa Co.'s debts and have borrowed \$50,000.

Development on Ironclad hill, Cripple Creek, the last few months, has demonstrated that the cyanide process can successfully treat thousands of tons of the oxidized ore there, and arrangements are being made to go into the business on a large scale. Stratton's Cripple Creek M. & D. Co. has thousands of tons, says Manager Rice, that can be treated at a profit by cyanide, and as soon as legal complications can be adjusted, leaching tanks will be scattered over their property to handle the dumps that average from \$5 to \$10 per ton.

On the Burns claim of the Acacia Co. on Bull hill, Baker and associates are working on the south end. They have put in machinery and will sink 150 feet before drifting. A vein carrying good values was cut at 80 feet.

The Dexter shipped a carload of ore last week which averaged \$30.

The Valley M. Co., leasing on the Shortloft No. 2 on Bull hill, is averaging fifteen tons per day, averaging \$90. The rock is broken on the 700 and 800-foot levels.

The damaged stacks at the Isabella, Cripple Creek, have been replaced and work resumed.

J. Nesbit is putting up a cyanide plant at Altman. He has leases on the dumps of the Pharmacist, Zenobia and Burns properties, within a short distance of the mill. The rock will be first treated as it comes from the mine without crushing, and Mr. Nesbit claims he will get 80% of the values. After this, the rock will be crushed and another 15% extracted. The time of treatment is twenty-four hours at most. Nesbit claims that he will be able to treat \$5 ore at a profit.

J. H. Hadley, of the Sioux City M. & D. Co. is considering a cyanide mill for the

Fort Wilcox property, next to the Fluorine of the Montreal Co. The Fluorine vein runs into the Fort Wilcox, but has never been worked. Lately the Sioux City L. Co., which also works the Fluorine claim, has been taking ore from the two properties, and has a shipment at the Eagle sampler which will go \$300 to the ton. The lessees will build a cyanide plant to handle the low grade oxidized ores.

It is reported from Cripple Creek that on the 1000-foot level of the Bluebird a 2-foot vein of dark fluorspar has been cut which shows free gold.

McInnis et al., leasing the north end of the Maud Helena of the Pilgrim Co., have found a vein which gives values of \$20. They have a shaft started.

Returns have been received on a 14-ton shipment sent by Gilmore & Searles, operating block G of the Morning Glory No. 2, of the Work M. & M. Co., Cripple Creek, which ran three ounces gold. The shipment consisted of sorted rock and slime from the washers, the average values from this lease being 1½ ounce. These lessees are operating from the Gilmore shaft. It is reported that Whetstone & Reed, leasing another block of this claim, have opened ore 3 feet in width near the line between the Morning Glory No. 2 and the Jackpot. The ore is believed to be an extension of the Jackpot vein. There are ten sets of lessees working upon blocks of this company's territory.

The Times, at Cripple Creek, says J. H. Rudd and M. Hawkins have taken a two years' lease on the Janet W. claim of the Republic Co. on Beacon hill. A royalty of 20% is required after deducting freight and smelter charges. The depth to which lessees may mine is 450 feet. The territory of the Janet W. from 450 feet down was previously leased to the El Paso Co.—S. McDonald, manager of the Strong and Gold King Co.'s, has a two years' lease on the Clara D. of the Lexington Co. on a royalty of 25%. This is the same ground from which Lessee Kirk last year took \$70,000.

Manager Hamlin of the Granite mine, near Cripple Creek, has started the tenth level south to prospect that end of the property. There are two dikes crossing the south end and it is intended to run out these workings to intersect them. These dikes have yielded ore at their intersection with the veins in adjoining properties.

Manager Keener says the crosscut being driven at the 500 level on the Eclipse Con. on the northwest slope of Battle mountain, near Victor, has cut the dike 100 feet. The ore carries from \$2 to \$9.—Danzell & Wilson, leasing on block 11 of the Victor, are making shipments. Lessees working on the War Eagle are shipping forty tons a day and have cleaned up \$25,000.

The Record says all the samplers of the district at Cripple Creek are crowded with ore, mining companies and lessees trying to make a record the last month of the year. At the Rio Grande, Eagle and Cripple Creek samplers two shifts are employed crushing 1500 tons daily.

Raid and associates, leasing the south end of the Burns, owned by the Acacia Co., are drifting on a shoot of ore, assays running as high as \$40. A trial shipment was sent out this week.

Manager Hanley of the Enterprise G. M. Co., at Cripple Creek, reports a strike in the shaft. Mr. Hanley recently let a contract to sink 100 feet. Last week they broke into a 4-foot vein that dipped into the shaft at 130 feet depth. Assays give \$3 to \$8 per ton.

The Gold sampler, at Goldfield, has been leased by Rice & Temple, who will convert it into a cyanide mill. The mill will have a capacity of fifty tons a day, to be increased later to 100 tons.

A strike has been made on the north end of the Zenobia, on Bull hill, owned by the Stratton Cripple Creek M. & Dev. Co. A short time since the directors had decided to close the mine, but Manager Rice requested two days' grace, within which time he crosscut from the 500 level into a vein east of the shaft from which 6 inches averages \$300. The entire breast is pay, the lowest assay being \$20.

Returns from two cars of ore sent from the Abe Lincoln, in Poverty gulch, owned by the Stratton estate, returned \$69.80 a ton.

The Practical Leasing Co., operating the Trachyte on Bull hill, Cripple Creek district, have found the vein 400 feet from the surface.

Miners in the employ of the Tillery lease on the El Paso, Cripple Creek district, are laying track in the Old Gold tunnel to workings in the El Paso, 4000 feet, where the extension of the C. K. & N. vein has been cut.

S. A. Hughes of Florence, W. McMillan of Colorado Springs and C. R. Peck of Salida have taken a five-year bond and lease on a group of four claims belonging to Davidson & Warwick. The property is in King's gulch, south of Salida, at the

head of the Sangre de Cristo range, and includes a millsite. The principal values are gold, silver, lead and copper.

Lessee O. P. Finn, on the Magna Charta ground on Ironclad hill, Cripple Creek, has put in two cyanide tanks, ten tons daily capacity each.—Franklin, Sifton & Co. of Colorado Springs, lessees on the Grace Greenwood, are building ore bins and a blacksmith shop and have started sinking a shaft.—M. J. McCormack is putting up machinery on the Annie on Gold hill.

During the month of November 5592 men were employed in the Cripple Creek district, the payroll amounting to \$569,001.91.

A strike is reported from the Golconda mine on the southeast slope of Squaw mountain, near Cripple Creek, in the old shaft on the south end of the claim, where 4 feet of ore, which runs \$45, has been found at a depth of 160 feet. Two million dollars has been spent on this property within five years without making a paying mine. It is owned by E. Ridgway of Philadelphia. It is in the granite. A new shaft house is to be erected at the new strike.

The sinking of the main shaft at the Ajax at Cripple Creek has been resumed. The shaft is 900 feet deep and will be put down to the 1000-foot level.

IDAHO.

IDAHO COUNTY.

P. Clark, it is reported, has given up his \$250,000 bond on the Jumbo mine in Buffalo Hump district. The owners will develop the property. They claim that a sixty days' run with a 2-stamp mill output \$62,000, with ore ranging from \$10 to \$24 per ton.

A 5-stamp mill for the Galena Creek Co. has been built near Elk City. The mill is run by water power. "In the spring," says J. D. Boyer, manager, "an electric plant will be put in to supply all the mills in the section with power. Our company will then add fifteen stamps."

The Snowhose Co., of which Mr. Boyer is manager, has set aside \$40,000 to open the claims. A contract for a tunnel will be let, and if developments warrant, twenty stamps will be put in.

SHOSHONE COUNTY.

Ore was found last week in the lower tunnel at the Reindeer, near Mullan, at 325 feet from the mouth. The mineral occurs in a ledge 3 feet wide composed of talc, spar, quartz and chalcophyrite. It is thought to be an offshoot from the main ledge. The company will drive ahead to the point under works where pay ore was found several months ago. Good headway is being made.

The Enterprise M. Co. are developing the Merrill claim east of the Hunter, near Mullan. In cleaning out an old tunnel they discovered the ledge. The people who drove the tunnel cut through the ledge without giving it attention, and not finding anything after drifting in the quartzite, abandoned it.

The Morning mine, at Mullan, has resumed operations with a full crew. The recent cold snap had caused a scarcity of water, which caused a shut down of the concentrator and mine. Four hundred men are employed.

T. F. Kelley of Chicago has bought for \$14,000 a three-sixteenths interest in the Yolande property, three claims and millsite, adjoining the Hunter mine at Mullan.

The station and hoist at the Hunter mine, at Mullan, were burned last week and the mine and mill have closed down. The company will rebuild. The fire started from a candle sticking in the timber near the engine. While the station man was landing a car the candle dropped out of the stick and ignited some oily cotton waste.

WASHINGTON COUNTY.

C. F. Macey, manager the Iron Springs M. Co., operating on Paradise Flat in Black Lake district, near Weiser, says a plant will be built in the spring. Experiments are in progress as to the best plan of reducing the ores.

The Signal says the Gold Coin M. Co. and the Rankin General M. Co. are keeping the road to Black Lake open. They have four 12-horse teams on the road from the railroad to the mines taking in supplies and machinery. The Gold Coin Co. will start their cyanide plant January 1st. The capacity of the plant, originally fifty tons per day, has been increased.

MICHIGAN.

HOUGHTON COUNTY.

The Calumet & Hecla Co. has in operation the filters through which all the waters used in the steam plant will pass. The capacity is 500,000 gallons per twenty-four hours.

On account of ice on Portage lake, boat shipments of copper have ended for the season and rail shipments begun. One of

the heads at the Atlantic mill started up last week on Winona rock, stamping 360 tons daily. It is reported that 15,000 tons will constitute the mill test.

The Calumet & Hecla has started up the smelters, which were closed during the coal strike, re-employing fifty men who were laid off.

MARQUETTE COUNTY.

A fire is reported in Section 16 mine at Ishpeming, a property of the Oliver M. Co. All the shafts have been sealed in an effort to smother the flames. It is thought no lives were lost. The mine employs 300 men.

MINNESOTA.

SAINT LOUIS COUNTY.

The Minnesota Iron Co. has let contracts for 1,200,000 yards of stripping. Of this, 700,000 yards—part from the Day mine at Hibbing and the rest at the Bent mine—has been secured by the Drake & Stratton Co.

MISSOURI.

JASPER COUNTY.

Zinc miners of the district about Joplin are arranging to export a large tonnage of ore to Europe with a view to raising the price of spelter.

MONTANA.

BROADWATER COUNTY.

Two carloads of ore were shipped last week to East Helena from the Quartette mine on Weazel gulch.

GALLATIN COUNTY.

Corundum is being shipped from the mill of the Montana Corundum Co., working the deposits near Bozeman.

MADISON COUNTY.

The Sentinel reports a strike in the Eagle, near Pony. The vein cut is 10 feet wide and assays \$25.

C. H. Hand, general manager the Watseca M. Co., operating the Watseca mine in the Rochester district, reports a strike in the Alameda vein, south of the 450-foot level. The ore is base, but they will concentrate and ship it. They have also opened a new shoot north of the shaft. This gives the company three veins of pay ore, and one about which little is known, as it has not been prospected enough to show its value. There are two shafts on the Watseca, one of which is 550 feet deep and on the pitch of the vein, and the other vertical 450 feet. Next month the latter will be sunk to the 600 mark. A mill is being built. A strike has also been made on the Longfellow claim, half a mile southwest of the Watseca. The shoot was cut at a depth of 300 feet. The property is owned by J. A. Murray and S. Lisa, of Butte, but worked by E. W. Merritt under a lease and bond. At the Elgin mine, owned by Butte men, sinking has been resumed and will go to the 450-level.

MEAGHER COUNTY.

A strike of 16 inches of copper glance is reported at Copper. J. Blewett, who formerly operated at Copper, has again taken charge.

MISSOULA COUNTY.

The construction of the smelter at Saltese has been started.

PARK COUNTY.

The Enterprise says D. L. Wing of Chicago has bought the Winslow & Burns placer workings in Emigrant gulch, near Livingston, making a total of thirty claims controlled by his company. All of these claims adjoin, giving 337 acres along Emigrant creek and cover both sides of the creek. It controls water right of 10,000 inches. Three steam shovels will be used, each weighing seventy tons, with a dipping capacity of 2½ cubic yards. The gravel will first be put over an 11-inch screen and this will leave 75% of clean gravel for the sluice boxes. There will be two sluices, each 600 feet long by 10 feet in width, one sluice being used while the other is being cleaned. Mr. Wing has named the property the Sallie B.

From Helena is reported the consolidation of the Bear Gulch mines in Park county, as the Kimberley-Montana G. M. Co. The new company acquires the mines and mill of the Gold King Co., the Revenue Co. and the Bush Estate. With the completion of the mill the company will have 100 stamps.

SILVER BOW COUNTY.

The crosscut at the 800 level of the Emma mine in Butte has cut the vein 325 feet from the shaft.

NEVADA.

ELKO COUNTY.

A 3-foot vein of free gold ore is reported in the Eclipse mine at Tuscarora.

The locators and operators interested in the oil fields of Elko county have formed the Elko Oil Association, and elected the following officers: President, E. S. Farlington; vice-president, W. Willis; sec-

retary, G. W. Bruce; treasurer, J. Herderson. T. Hunter, J. A. McBride and A. W. Hesson are members of executive committee.

ESMERALDA COUNTY.

The Vulcan C. M. Co. has paid off the attachment of \$2000 placed against it by N. A. Dunyon, and has resumed with ten men at work.

HUMBOLDT COUNTY.

The mill at Mill City is running on ore from the Arizona mine at Dun Glen. The Sheba Co. is to build a mill at Star City.

It is reported from Antelope valley that C. Hayes, of Bridgeport, has made a strike on a claim in Antelope, joining the Golden Gate.

LINCOLN COUNTY.

A new 10-stamp mill for the Quartette Co. is to be built by the Risdon Iron Works, of San Francisco, Cal. The mill will have cement mortar blocks, 1000-pound stamps and a complete modern equipment. A Fairbanks-Morse gas engine will furnish power. The millsite is being graded and it is expected to have the mill completed by March 1, 1903. In the Quartette mine a station has been cut at the 600 level.

Five prospect shafts are being sunk on the McGee group in Silver King, the new mining district. The gold values run from \$15 to \$150 per ton.

NYE COUNTY.

(Special Correspondence)—The most important event of the week at Tonopah is the strike in the Montana-Tonopah, lying north of the Mizpah. It has been a question in Tonopah whether the Mizpah ore shoot extended north of the Tonopah Co.'s holdings, but this find proves that it does.

W. Oshorn, formerly with the Electro-Geodetic Surveying Co., is building a mill 4 miles north of Tonopah, at Butler's wells, to treat the low-grade ores of the camp—several thousand tons of which are on the dumps, lessers having shipped the high-grade ores. This is the most important step taken thus far for the larger development of the district.

Tonopah-Gold Mountain, 4 miles south of Tonopah, continues to attract the attention of prospectors and mining men, on account of surface showings.

The Colehan shaft on the Tonopah-Union is down 80 feet on a vein 14 feet wide, carrying values ranging from \$20 to \$200 gold. The values occur in crystallized quartz. The formation is porphyry and rhyolite.

Tonopah, Dec 18.

Following the recently reported strike on the 400-foot level of the Mizpah at Tonopah, the next day the ledge was cut on the 500 level and a rich vein exposed.

Thursday of last week, an 8-foot vein was cut in the Colehan-Gold Mountain property that went \$30 in gold, and on the Fraction an ore body was found in shaft No. 5, 400 feet west of the old strike. The rock is full of wire silver.

Friday, in the south drift of the 300 level of the Mizpah, the Valley View ledge was cut, 11 feet wide of shipping ore.

It is reported that a vein had been cut in the Montana-Tonopah.

The Ohio-Tonopah is down 400 feet; the Montana, 390 feet; the North Star, 480; New York-Tonopah, 500; Tonopah City, 380; Gold Hill, 380; Mizpah, 500, and Wandering Boy, 500.

At the Belle of Tonopah property, adjoining Montana-Tonopah on the north and King-Tonopah on the west, the shaft is down 100 feet, with the bottom in porphyry showing stringers of quartz. A hoist will be set up. F. K. Thorn is superintendent.

At the Fraction, near Butler, the north and south drifts from the 400-foot level, shaft No. 2, are in 175 feet. The crosscut from shaft No. 1 is in 275 feet, and connection with the north drift from shaft No. 2 will soon be made. Another shipment of ore was made this week.

Since placing machinery in position the Little Tonopah D. Co. have sunk 55 feet, and sinking 4 feet a day. Two shifts are employed. The bottom of the shaft is now in mineralized limestone.

F. B. Work, superintendent of the New-house properties at Hanapah, says a drift has been started from the 80-foot level and is now in 10 feet.

The shaft at the Ohio-Tonopah is down 380 feet and has passed through the volcanic ash and mud and is in a hard formation of rhyolite.

The Tonopah-Silver Top M. Co., whose property is 2000 feet northwest of the Mizpah in Oddle mountain, have a shaft down 60 feet. Manager T. Fleming says he will put in a steam hoist, sink deeper and crosscut.

The Butler M. Co., owning nine claims near the Little Tonopah D. Co., a mile and a half northwest of Butler, has incorporated under the laws of Arizona.

Manager F. Thorn, the Tonopah Union M. Co., on Gold mountain, reports an 8-

foot ledge of \$20 gold ore in the main shaft at a depth of 80 feet.

The Kennelworth-Tonopah G. M. Co. is incorporated; J. H. Wright, president; W. J. Taylor, F. E. Meek, W. O. Mumford, L. H. Conley, J. Straub. The company owns ten claims and a tunnel site, 18 miles northeast of Tonopah. Preliminary work has been done on all the properties. J. Straub is superintendent.

W. Osborn will put up a quartz mill for custom ores, at Butler's wells, 4 miles from Butler; capacity, five tons daily.

It is reported that Hannapah, 18 miles east of Butler, will be included in the survey being made of the Tonopah district by the United States Geological Survey.

The tunnel of the Mizpah mine, in Tonopah, has broken into the Lynch and O'Meara workings at a depth of 250 feet.

STOREY COUNTY.

Work at drill hole No. 3 on the Brunswick lode at Virginia City has been temporarily suspended, the hole having caved. The hole will be reamed and cased.

At the Con. Cal. & Va. last week thirty-three cars, assaying \$49.34 gold, were taken out, and 215 cars assaying \$20.61.

WASHOE COUNTY.

Work is resumed at the Brighton mine near Washoe City. The Harris mine has resumed and ore is being taken out.

Governor Sparks has sixty men in his mines and mill in Wedekind district.

WHITE PINE COUNTY.

The contractors will drift 500 feet on the 700 level of the Starr mine, near Cherry creek.

NEW MEXICO.

GRANT COUNTY.

The sale of the Comanche group of thirty-eight claims and the Klondike mine in the Burro mountains, near Silver City, to the Comanche M. & S. Co. of Milwaukee, Wis., has been closed. S. S. Curry of Ironwood, Mich., is president.

GUADALOUPE COUNTY.

The O. K. crude oil well in the Santa Rosa oil field is down 900 feet. The Con. Oil Co.'s well is down 936 feet, at which point the drill broke, causing a delay of two weeks.

It is reported that C. H. Taggart of the Pintada M. & C. Co. struck a small flow of oil while drilling for water at the property of the company.

LINCOLN COUNTY.

At Nogal, the American M. Co. has installed pumps to handle the flow of water expected to be tapped when the ore body is cut at the 500-foot level.

RIO ARRIABA COUNTY.

It is reported that Cleveland, Ohio, men have bought the mica-bearing veins near the Mexican plaza at Petaca.

OREGON.

BAKER COUNTY.

(Special Correspondence).—The Wellington G. M. & M. Co. at Huntington have sent a plant of hydraulic machinery to Baker City to work placer ground owned by them. Average value per cubic yard is reported to be 60 cents, with a deposit 20 thick. They expect to handle 1000 yards per day. On the same ground a 3-foot vein of sulphide ore running \$57 has been found.

Baker City, Dec. 14.

At the Columbia mine, near Sumpter, a 200 H. P. electric plant is being installed for operating the mill and hoist.

The plant at the California is nearly finished.

The shaft on the Golden Wizard is down 140 feet. A large pump has been bought. The new hoisting plant will go 1000 feet. A mill is also talked of by the management.

Preparations are being made to start the 40-stamp mill at the Bonanza. It has been closed since sinking began in the main shaft last summer; 400 feet has been sunk since; 200 feet more will reach the 1000-foot mark. A large body of ore has been opened up.

The cyanide plant at the Cougar has made a test run.

JACKSON COUNTY.

A cyanide plant is being built at the Dewey mine, near Gazelle.

JOSEPHINE COUNTY.

The Baby quartz mine, in Jump-Off-Joe district, near Grant's Pass, has been bonded to C. C. Higgins of Salt Lake City, Utah.

N. E. Smith, owning the St. Helena placer mines at Waldo, says the parties having a bond on the property have stopped work for the winter because of snow and a slide, which carried away part of the ditch. The gravel is hydraulicked, the water being brought in 5½ miles by ditch and flume.

The 10-stamp mill at the White Swan mine is running on ore from the third level. A station pump is being set up on the third level.

SOUTH DAKOTA.

LAWRENCE COUNTY.

At Deadwood the Imperial G. M. Co. is reported to be planning the enlargement of its cyanide plant. New finishing rolls and tanks are to be added and the capacity of the mill increased from 125 tons to 250 tons per day. The building originally designed for a roaster will be used for a leaching room.

A new ore shoot has been found by the University G. M. Co. in the South Dakota ground on Annie creek, south of Deadwood. Most of the ore is oxidized and assays \$24, the rest carrying \$32. The latter is a smelting ore and will be shipped.

The Columbus Con. at Lead has opened up new ore bodies at the northern end of its territory on Blacktail gulch. The find was made while continuing old workings bought by the Columbus last summer, and is parallel to the other ore bodies that the company has been working.

Since their discovery in 1876 the Black Hills mines have produced \$121,000,000 in gold and silver, largely the former, and by far the larger portion from this county.

A test of 300 tons of tin ore from Bear Gulch district is to be made at Deadwood.

PENNINGTON COUNTY.

The Gold Standard Dev. Co. has bought several mining claims near Pactola. The veins exposed on the property show a free-milling ore running \$6 per ton in gold. G. Philipps is superintendent.

TEXAS.

HARDIN COUNTY.

C. G. Parsons, of Bryan, reports having sold two and one-half acres of his Sour Lake oil land to G. E. Hart, of Beaumont, for \$2000 an acre, making twenty and one-half acres Parsons has sold to the same party.

JEFFERSON COUNTY.

The National Refining Co., of Beaumont, has bought five acres of land 3 miles south of the city, on the Port Arthur Railroad line, and will put up a refining plant that will turn out 100 barrels daily of refined product from the Beaumont crude oil.

UTAH.

BEAVER COUNTY.

It is reported the Imperial Copper M. Co. has bought the Comet and Massachusetts groups near Frisco. The Comet adjoins the Cactus and Massachusetts in Lober gulch. The Imperial tunnel, being driven through Massachusetts territory, is in 900 feet.

The Vicksburg G. & C. M. Co., at Milford, reports a vein of carbonate ore in the shaft.

Superintendent W. A. Wilson, the Sheep Rock mine, near Beaver, has let a contract to sink the shaft 160 feet to the 300 level, where a crosscut will be run to the vein.

J. H. Dupaux, part owner in the Amelia M. Co.'s property, near Beaver, has taken a two years' lease and bond on the interests of the other shareholders. The company's ground consists of four claims ½ mile east of the Burning Moscow.

Salt Lake men have an option on the Washington group, in Labor gulch, west of Frisco, for \$50,000. They have started to sink a shaft. The Washington, near the Massachusetts, has a steam hoist.

JUAB COUNTY.

The West Tintic Iron King Con. M. & M. Co. has incorporated. L. Ludvigson, C. Christensen, J. R. Sallsbury, H. D. Goldsbrough and D. F. Dowd. The company will operate six mining claims in the West Tintic district.

The Miner says the third furnace of the United States smelter, at Eureka, was blown in last week. The capacity of the plant is 500 tons of ore daily.

For eight carloads of ore, containing 232 tons, the Lower Mammoth Co. received \$4338 net from the smelter. The consignment was sold on controls showing fifty-four ounces silver, 2% copper and 85 cents gold.

Manager Allen of the Centennial Eureka reports the tramway at the Tintic property is handling twenty tons an hour.

SUMMIT COUNTY.

Superintendent J. S. Foe of the Park City G. & S. M. Co., reports pay ore at a depth of 55 feet in the shaft on Success ground, being a shoot of lead carbonates, which returns 9% lead and 24.3 ounces silver.

The Record says the Bogan and Silver King Extension properties, near Park City, have been incorporated as the Silver King Con. M. Co. of Wyoming. W. W. Bradley, H. Cohen, A. F. Harrison, H. L. Miller and J. C. Hamm. J. H. Keetley is superintendent.

The new Park City sampler is in operation.

Manager A. H. Mayne has the new hoist at the Minola in operation. A com-

pressor is to be installed. The shaft is down 200 feet.

TOOELE COUNTY.

Assays of samples from the face of the drift in the Clifton Belt M. Co.'s property at Deep creek have been received by Manager Wilson in Salt Lake City, showing the ore to carry 16.2% copper, \$4.20 gold and 5.4 ounces silver.

Superintendent Raddatz says connection between the two headings of the Honerine tunnel at Stockton has been made, which makes the tunnel 2800 feet long. In addition to driving, an air shaft was sunk 280 feet to the plane of the tunnel from which to begin another heading. The tunnel will open up the ore bodies of the Honerine and other mines that will be drained by it.

J. Brewer and S. C. Dallas are at work on the Accident group in Dutch mountain, Clifton district, near Gold Hill. They have 150 feet of work done and expect to make 100 feet more before closing for the year. The rock is a copper-silver ore.

A. and T. Sunderland have resumed work on the Commerce and Midland lodes, adjacent to the Footman. There is 119 feet of tunnel and a 40-foot shaft.

UTAH COUNTY.

A strike is reported in the Thistle mine, near Spanish Fork, last week in the drift running north on the 100-foot level. The assay shows 126 ounces silver and \$4 gold. They have cut the same ore body at the bottom of the shaft.

WASHINGTON.

FERRY COUNTY.

J. F. Lansing of the San Poil Lumber Co. has bonded for \$24,000 the Blue Horse group of five claims on Iron mountain, near Republic. The vein has been opened by a 50-foot shaft, with a 30-foot drift from the bottom.

W. F. Bassett reports that in a drift from the Growler mine, on Copper mountain, from the end of the tunnel the vein is 4 feet wide, carrying ore which runs \$19 in silver and \$3 in gold.

OKANOGAN COUNTY.

Superintendent E. P. Gaillac of the Beaver Lake M. Co., near Chasaw, reports having crosscut at 300 feet in the tunnel a body of copper ore, and as soon as there is sufficient snow for sleighing will begin shipping to the Boundary smelters.

The Opal M. Co., of Columbus, Ohio, last week bought the Ben Harrison group of four claims, near Chasaw. W. C. Peay is manager.

M. M. Walsh, general manager for the Monterey M. Co., reports that men in the big tunnel at the Buckhorn have been laid off on account of bad air pending the placing of a new air plant. The tunnel is in over 1000 feet.

The Chesaw Improvement Co. has begun work on a group of claims near town and is finding good ore.

The tunnel on the Six Eagles is in 850 feet, with three shifts at work. The ground is hard and dry. Several stringers have been cut. C. F. Hagerty is foreman.

SNOMOMISH COUNTY.

The Copper Bell, near Index, reports a strike of chalcopryite.

WYOMING.

ALBANY COUNTY.

Hoisting machinery is being put in at the Emma G. mine in the Cooper Hill district, north of Laramie. The shaft is down 135 feet and it is proposed to sink to the 200 level and crosscut to the vein.

CARBON COUNTY.

It is reported that coal from the Bemls and Oesterberg mine, 22 miles northwest of Saratoga, is of coking quality, and in this form will be used in the smelter at Grand Encampment and at the New Rambler.

The Tribune reports the New York & Utah drill at Price has penetrated oil sand and that oil is coming into the hole.

It is reported the North American Copper Co., near Encampment, has bought the Osceola and Olive D., adjoining the southerly line of the Rudefeha properties, for \$200,000. The dip of the vein on the Rudefeha is southerly and on an incline that would carry it into the Osceola and Olive D. grounds. The North American owns the Rudefeha.

FOREIGN.

BRITISH COLUMBIA.

The Wilcox mill and the aerial tramway are in operation at Ymir.

At Minneapolis, Minn., is incorporated the Lardeau-Duncan Development Co. of British Columbia, to develop the Primrose and Golden Circle properties in the Lardeau-Duncan district.

The development on the Oyster-Criterion group, in the Lardeau district, aggregates over 900 feet, and a 10-stamp mill has been bought. A compressor

plant is contemplated by Manager Pool. Motive power will be derived from Pool creek.

The Ethel mine, near Trout lake, is preparing to ship, having ready twenty tons of first-class and 200 tons of second-class. The first-class will average 300 ounces, the second-class will run from \$25 to \$30 per ton.

It is reported that E. J. Edwards has taken a lease and bond on the Bluejay in Skylark camp, near Phoenix, and will work the mine this winter.

Of ten tons of ore treated at Hail Mines smelter, from the Hampton, near the Arlington, Siocan, the first grade yielded 1983 ounces of silver and the second grade 566 ounces. The lead is 100 feet wide, with paystreak on the hanging wall.

The Bosun, near Sandon, has seven ore sorters separating zinc for shipment to Iola, Kans. Seventy tons were shipped this week.

The production of ore in Rossland camp for the first eleven months of 1902 was nearly 40,000 tons greater than for 1901.

The War Eagle and Center Star mines at Rossland are making concentration experiments with a view to improving methods and increasing output.

At Camp McKinney the Cariboo-McKinney M. & M. Co.'s mine and mill are working. On the Waterloo ten men were at work, with J. Harvey in charge. In the face of the drift, 150 level, there are 4 feet of gold quartz.

At Fairview the new Fairview Co. is completing the cyanide plant. No mining or milling in progress on the Stenwinder pending the completion of the cyanide plant. At Hedley City the Nickel Plate stamp mill is being built. The masonry foundations for the mill and the flume are in course of construction. The tramway from mine to mill is being built. Part of the way will be a gravity line and the remainder electric.

About 200 tons of ore were shipped from the Silver King mine, near Nelson, last week for treatment at the Hail mines smelter.

It is reported the East Crow's Nest C. & C. Co. of Spokane, Wash., has bought 540 acres of coal land near Alberta for \$70,000.

The Iron Mask, near Kamloops, reports having crosscut its ore body 75 feet wide that runs 6% in copper.

Smelter returns from the last car of ore shipped to Trail from the Providence mine, Greenwood, weight 33,152 pounds net, gave gross proceeds after smelter deductions of \$2442.09. There are seventeen men employed at the mine, drifting and sinking the shaft.

An incline will be sunk 400 feet on the Dewey, 6 miles south of Kamloops. The property is owned by J. G. McMillan of Roche Harbor and H. L. Dickson.

CHINA.

H. Capler, of Gridley, Cal., has returned from the province of Mongolia, North China, to secure men to go with him to the gold fields of Mongolia. He has also secured a dredger. The lands, known as the Ion property, include 10,000 acres, part of which is adapted to dredging and hydraulicking. J. T. McCall, of San Francisco, Cal., spent two years in prospecting the Ion property.

MEXICO.

GUANAJUATO.

Mining conditions in Guanajuato will be improved upon the completion of the power plant of the Guanajuato Power Co. One thousand men are employed in building dams, reservoirs and canals, etc. This will soon be completed, when the work of putting the transmission line to the Guanajuato mining district will be begun. The company expects to be able to deliver power in Guanajuato by July 1. President Hine says the transmission line will be 110 miles long, carried upon steel towers. Each of these will be 46 feet in height, carry three lines of transmission. There will be twelve such towers to the mile. There will be 1320 towers. The transmission line will carry 800 H. P. delivered at Guanajuato. To generate this the waters of a stream have been diverted and conveyed through a 5-mile canal and delivered to Pelton wheels under a head of 328 feet. The officers of the company are: H. Hine, president and general manager; J. H. Hammond, vice-president; L. E. Curtis, vice-president and treasurer; I. W. Bonbright, secretary, and E. R. Coffin, assistant secretary and treasurer.

LOWER CALIFORNIA.

In the Viznaga mine, in Alamo district, 75 miles from Ensenada, a 7-foot ledge is reported, rich in gold. H. M. Russell, the principal owner, has sent a brick weighing \$3555 to Los Angeles, Cal. This amount is reported to have been taken from 600 pounds of ore. The company has a 5-stamp mill in the district. The best mine of the company has been the Aurora, which has been worked continuously fifteen years.

Personal.

G. C. HEWITT, Colorado Springs, Colo., is in Mexico.

J. S. SEMONES has returned to Denver from Silverton, Colo.

J. A. SHINN has returned to Leadville, Colo., from Denver, Colo.

T. SHELTON of Leadville, Colo., has returned there from Denver.

W. H. HILL has gone from The Needles, Cal., to Milford, Utah.

P. COLLINS is assayer at the Portland mill, Colorado Springs, Colo.

D. V. DONALDSON, Colorado Springs, Colo., is in Philadelphia, Pa.

H. A. VON HEMERT, Colorado Springs, Colo., is in Los Angeles, Cal.

F. ROYER of Denver, Colo., has returned there from Old Mexico.

T. S. FARRIS has returned to Cripple Creek, Colo., from Grand county, Colo.

A. W. BOYD is superintendent of the American Eagle mine in Elk City, Idaho.

F. F. THOMAS, manager Gwin mine, Calaveras county, Cal., is in San Francisco, Cal.

G. M. MACNEILL, general manager U. S. R. & S. Co., Colorado Springs, Colo., is in Europe.

W. C. RALSTON, manager Melones M. Co., Melones, Calaveras county, Cal., has gone East.

H. A. COHEN of Salt Lake, Utah, has resigned his connection with the DeLamar properties.

B. MATTISON has accepted a position as foreman Trade Dollar mines, at Silver City, Idaho.

G. W. BARTHOLOMEW of Debeque, Colo., is inspecting copper mines in western Arizona.

W. L. WATTS of Los Angeles, Cal., is examining mines near Carters, Tuolumne county, Cal.

E. C. VOORHIES, superintendent Lincoln mine, Sutter Creek, Cal., is in San Francisco, Cal.

D. MCCLURE, superintendent Gwin mine, Calaveras county, Cal., is in San Francisco, Cal.

JOHN GRAY of Prescott, Ariz., is superintendent Poland Extension mines, Poland, Yavapai county, Ariz.

SUPERINTENDENT MOYNAHAN of the Home Run mine, Groom Creek, Ariz., has returned from the East.

W. C. HUNTER, assayer at the Standard Con. M. Co., Bodie, Cal., has returned from San Francisco, Cal.

J. L. MERY, draughtsman and engineer for the United Verde C. Co., Jerome, Ariz., is in San Francisco, Cal.

J. C. JENS of the Iowa Con. M. Co. at Rich Gulch, Calaveras county, Cal., has returned from New York City.

P. HOOK, superintendent the Democracy mine at La Cananea, Sonora, Mex., has returned from Bisbee, Ariz.

P. E. MURRAY, superintendent of the Zubieta mines in Sonora, Mexico, has returned from San Francisco, Cal.

A. B. CALL of New York, who has been making mine examinations in the State of Nevada, is in San Francisco, Cal.

SUPERINTENDENT CARMICHEL of the Confidence mine, Confidence, Cal., has returned to the mine from Nevada.

J. H. BAKER of El Paso, Texas, is now superintendent of mill for Columbia M. & M. Co., Bacarra, Sonora, Mexico.

A. BUCKBEE of the Virtue mine, Baker county, Or., has gone to Montreal, Canada, to consult with his company.

F. R. CULBERTSON of San Francisco, Cal., manager Chloride-Bailey mines, Trinity county, Cal., is at the mines.

C. M. DABNEY of San Francisco, Cal., has gone to Butler, Nev., to look after his mining interests in Tonopah district.

LEON M. HALL of San Francisco, Cal., has returned from the Con. California & Virginia mines at Virginia City, Nev.

F. BROWNELL, superintendent of the Producer M. & M. Co., Quijota, Pima county, Ariz., is in San Francisco, Cal.

G. W. HORN, superintendent the Horn mine, near Defender, Amador county, Cal., has returned from San Francisco.

T. FLEMING, secretary and manager the Tonopah-Silver Top M. Co., Butler, Nev., has gone East on company business.

SUPERINTENDENT W. C. WYNCOOP of the Liberty group, Butler, Nye county, Nev., has returned from Philadelphia, Pa.

L. H. CARVER, E. E., C. E., of San Francisco, Cal., has returned home from an inspection of mines in Butte county, Cal.

W. C. GREEN, for the past five years with The Mine & Smelter Supply Co. of Denver, Colo., has accepted a position as western representative of Revere Rubber

Co., Boston, Mass., with headquarters in Denver.

GENERAL MANAGER M. B. KERR of the Jumper Syndicate properties at Stent, Cal., has returned from San Francisco, Cal.

H. L. JOHNSON, superintendent of the Oriental mine Allegheny, Sierra county, Cal., is in San Francisco on a business trip.

W. STANLEY of Denver, Colo., has been in Vanderbilt district, Cal., looking after the mining interests of the A. G. Campbell estate.

K. F. HOFFMAN of San Francisco, Cal., is superintendent Melones M. Co., Melones, Calaveras county, Cal., vice F. Langford, resigned.

D. McFALL, superintendent of the Home mine, near Nevada City, Cal., has returned from a business trip to San Francisco, Cal.

SUPERINTENDENT G. L. HUTCHINS of the Carbonate mine, Frisco, Utah, has taken charge of the Copper King mine in Star district, Utah.

F. FUNK, formerly foreman at the Morning mine, Mullan, Idaho, is now acting in a similar capacity at the Helena-Frisco mine at Gem, Idaho.

N. E. SMITH of the St. Helena G. M. Co., Waldo, Or., is in San Francisco, Cal., and goes next week to Arizona to look after mining interests there.

J. S. PALMERLEE, electric engineer the Copper Queen M. Co. at Bisbee, Ariz., has resigned and will manage mining properties in which he is interested.

JOHN ROSS, JR., superintendent Wildman Syndicate, Sutter Creek, Cal., is at the Chloride-Bailey mine, Trinity county, Cal., on professional business.

G. R. ADAMS of the Oquirrh-Bingham properties, Bingham, Utah, has been succeeded as superintendent by H. A. Brown. Mr. Adams has gone to South Africa.

At a meeting of the claim owners of the Tintic district, Utah, held at Silver City on the 13th inst., W. D. Wilson was elected mining recorder for the ensuing term of two years.

G. DOUGLASS, C. E., and R. E. PALMER, E. M., of the Rio Tinto mines of Spain have been investigating mining and metallurgical methods in the Lake Superior copper region.

E. R. WOAKES of Nelson, B. C., who has been visiting the mother lode at Sutter Creek, Cal., the guest of E. C. Voorhies, superintendent of the Lincoln mine, has returned home.

SUPERINTENDENT CHASE of the Liberty Bell properties, Telluride, Colo., has returned from Denver, Colo., and Manager Winslow of the Liberty Bell is at Telluride from Kansas City, Mo.

EDWIN REYNOLDS, long general superintendent E. P. Allis Co., and chief engineer Allis-Chalmers Co., is now consulting engineer. I. H. Reynolds, his nephew, succeeds him as chief engineer.

Commercial Paragraphs.

THE Paraffine Paint Co. of San Francisco, Cal., have bought thirty-four lots near the S. P. Co.'s track, West Berkeley, Cal., for an increased plant to double the output of P. & B. paint.

R. MCF. DOBLE, of San Francisco, Cal., is planning a 150-mile transmission line on steel towers for the Guanajuato P. & E. Co., Guanajuato, Mexico, the towers to be 440 feet apart, the line voltage to be 60,000.

At the regular meeting of the New England Railroad Club at the Pierce Hall, Boston, on December 9, a paper on "Electrically Driven Shops" was presented by R. L. Warner, Boston sales manager of the Westinghouse Electric & Manufacturing Co. Mr. Warner's paper was illustrated by a large selection of stereopticon views, showing many examples of the application of direct current and induction motors to the driving of machine shops, tools and other apparatus.

In the issue of the 6th inst. appeared a notice of the purchase of the stock, business and good will of the firm of John Taylor & Co. of San Francisco, Cal., by F. W. Braun & Co. of Los Angeles, Cal. In connection therewith, under recent date, F. W. Braun & Co. write: "We take pleasure in advising that we have purchased the stock, business and good will of John Taylor & Co., the well-known dealers in assayers' materials, laboratory, mine and mill supplies, 63 to 67 First street, San Francisco, Cal. We shall continue the business in San Francisco, aiming to add largely to the stock and facilities, so as to insure quick and satisfactory dispatch of all orders and business entrusted to us. Geo. B. Crooks, who for so many years was associated with John Taylor & Co., continues with us, as will also most of the employees of the retiring

firm. Wm. Roslington, for several years connected with our firm, assumes the management of the San Francisco house. We hope to be accorded the same liberal favors that our predecessors enjoyed, and will endeavor by careful attention to orders, and correct business methods, to merit confidence, good will and kind preference on orders. In taking over the business of John Taylor & Co. we will make no change in our Los Angeles house, which will be continued as heretofore, and we hope the enlarged field of operations opened up to us in conducting both houses will so increase our output of goods as to make our purchasing power and facilities for business such as will make ours the leading house in the line in the United States, if not in the world."

Catalogues Received.

"Wire Rope Tramways" is the title of the latest catalogue of the Trenton Iron Co., Trenton, N. J. It is a revised reissue of former publications on the subject of wire rope trams. It is profusely illustrated, showing the successful operation of the Bleichert tramway in places where transportation would be impossible without the aid of an aerial tramway. It calls particular attention to two new devices—the patent locked-coil track cable and the Webber compression grip, with automatic attacher. This little volume, which will be sent to those desiring it upon application, appeals to those who have difficult problems in transportation to overcome.

Catalogue No. 4, "Steam Engines and Boilers," issued by Harron, Rickard & McCone, 21-23 Fremont street, San Francisco, Cal., is worthy the attention of those interested in the subject. There are 164 pages, finely produced, of sizes, specifications, description and illustrations, with details of structure, dimensions, and other practical data. A convenient correspondence code is appended.

Universal dry concentrator, quartz crushers, screening machinery, crushing rolls and drying machinery are the subjects of catalogues received from the Krom Machine Works, 170 Broadway, N. Y.

Obituary.

GEORGE CUMMING, a prominent Pacific Coast inventor and engineer, died at his home in San Francisco, Cal., on the 14th inst., aged 78. In 1852 he was chief engineer of the Pacific mail steamship Panama. When the Risdon Iron Works of San Francisco was founded he was made its foreman, and in succeeding years had much to do in a mechanical way with the mining industry of California. Among other devices, he invented and put in general use a portable steam stamp mill and a portable miner's forge.

On the 12th inst., George W. Prescott, for several years president Union Iron Works, San Francisco, Cal., died at his residence in San Francisco, Cal., aged 69. In 1863 he bought the Donahue Iron Works of San Francisco, in 1875 the firm was changed to Prescott, Scott & Co., and in 1883 incorporated as the Union Iron Works. Mr. Prescott was its first president, resigning in 1890.

G. S. MORE, at one time superintendent of the Confidence mine, Tuolumne county, Cal., and more recently on the office staff of the Utica mine at Angels, Calaveras county, Cal., died December 11 at Angels, Cal., at the age of 39.

Books Received.

"Ancient and Modern Engineering and the Isthmian Canal," is the title of a handsome volume by William H. Burr, C. E., 8vo, XV+473 pages, profusely illustrated, including many halftones. It is a book of great interest to engineers in all branches of their profession and of absorbing interest to the non-technical reader. It deals with great engineering enterprises, bridges, steel buildings, railroad work, etc. Particularly apropos is the portion devoted to the competing routes for an isthmian canal in Central America, of which it contains complete engineering data. \$3.50 net, postage 27 cents additional. John Wiley & Sons, New York, N. Y.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONVEYING APPARATUS—No. 715,471. Dec. 9, 1902. F. A. French, San Francisco, Cal. This invention relates to improvements in transportation systems whereby it is desired to convey by means of suspended cables a burden in either a longitudinal, transverse or vertical direction in rela-

tion to a certain surface area. It consists of suspended cables, a burden carrier adapted to be supported upon and to be moved by said cables, independent fall lines whereby the burden may be deposited or taken up at any point, means for supporting said fall lines, and means for operating lines and cables. There is also an automatic discharge device between the fall rope and the load whereby the load is discharged by the movements of the rope.

CAN SEALING DEVICE.—No. 715,397. Dec. 9, 1902. A. W. Livingston, Alameda, Cal. This device is designed for the hermetical sealing of containing cans without the use of solder. It comprises a can head or cover consisting of a central body, a peripheral flange and permanently attached flexible cemented coated filament, said filament having a fibrous body of sufficient thickness to render the same capable of being compressed and flattened transversely to form a relatively wide flat packing when the seam is closed thereon.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING DECEMBER 9, 1902.

715,234—OIL BURNER—G. W. Arper, Oakland, Cal.
715,534—DISPENSING LIQUORS—S. H. Atchison, S. F.
715,535—VINE CUTTER—J. M. Barnes, Fresno, Cal.
715,635—HARNESS—Beideman & Cameron, Union, Wash.
715,634—SPLIT PULLEY—J. W. Berry, Tacoma, Wash.
715,548—BURNER—H. B. Cary, Los Angeles, Cal.
715,549—OIL BURNER—H. B. Cary, Los Angeles, Cal.
715,550—TRY SQUARE—H. B. Cary, Los Angeles, Cal.
715,553—OIL BURNER—H. B. Cary, Los Angeles, Cal.
715,731—WINDOW LOCK—"I." Chope, S. F.
715,471—CONVEYING APPARATUS—F. R. French, S. F.
715,375—DOOR HANGER—J. Handschmacker, S. F.
715,480—MOTOR—J. G. Hudspeth, Berkeley, Cal.
715,397—CAN SEALING DEVICE—A. W. Livingston, Alameda, Cal.
715,414—ROPE TRAMWAY—"A. Painter, S. F.
715,419—INK ERASER, ETC.—H. Pease, Portland, Or.
715,289—GATES—G. W. Peck, Greenville, Cal.
715,599—SHOELACE—E. L. Pitts, Jerome, Ariz.
715,294—WINDOW SHADE—M. E. Reilly, Everett, Wash.
715,318—RAKE—W. S. Richards, Albany, Or.
715,918—STEAM BOILER—Thomas & Stetson, S. F.
715,320—PLOW—I. L. Umstead, Camarillo, Cal.
715,441—FLUID PUMP—W. C. Vandergrift, S. F.
715,324—CAN TESTING MACHINE—Wachhorst & Ross, S. F.
715,326—PLANNER CHUCK—S. E. Walling, New Whetcom, Wash.
715,725—ROPE DRIER—D. Wieting, Meridian, Or.
715,725—ROTARY ENGINE—F. E. Womer, Fairhaven, Wash.
715,328—CONCENTRATOR—G. E. Woodbury, S. F.
715,730—THEATER APPLIANCE—A. M. Zinn, Spokane, Wash.

Latest Market Reports.

SAN FRANCISCO, Dec. 19, 1902.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver, 48½c, refined (1000 fine); San Francisco, 48½c; Mexican dollars, 37½ @ 38½c San Francisco, 38½c New York.

Silver shows a slight upward tendency. It is probable, however, that no material advance in price can be anticipated until silver is utilized more extensively in manufactures and arts.

COPPER.—New York: Standard, \$10.75; Lake, 1 to 3 casks, \$11.65; carload lots, \$11.30; Electrolytic, 1 to 3 casks, \$11.45; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.35; carload lots, \$11.10. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18 @ 24c. London: £50 11s 3d spot per ton.

The copper situation is practically unchanged. There has been a slight upward tendency during December, probably due to concerted effort on the part of sellers to secure the best possible price on contracts for the first quarter of 1903.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: £10 16s 3d per ton.

SPELTER.—New York, \$4.90; St. Louis, \$4.50; London, £19 17s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13 @ 15c.

TIN.—New York, pig, \$25.75 @ 25.87½; San Francisco, ton lots, 27c; 500 lbs., 27c; 200 lbs., 27½c; less, 28c; bar tin, \$3.32c. London, £116 7s 6d spot.

PLATINUM.—San Francisco, crude, \$18.00 @ 19 oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75 @ 80c per gram.

QUICKSILVER.—New York, \$45.00 @ 46.00; large lots; London, £8 15s; San Francisco, local, \$46.00 @ 47c; 70½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99½ pure ingots, 35c; No. 2, 90½, 30c to 34c.

SOLDER.—Half-and-half, 100-lb. lots,

18c; San Francisco, Plumbers', 100-lb. lots, 15.10c.

NICKEL.—New York, 50@60c $\frac{1}{2}$ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$24.25; gray forge, \$21.15; San Francisco, bar, 3c $\frac{1}{2}$ lb., 3c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$28.00@30.00; open hearth billets, \$32@34.00; San Francisco, bar, 7c to 12c per lb.

CEMENT.—Germania, \$2.50@2.75; K. & B. S., \$3.00; Hewmoor, \$2.90; Trowell, \$2.90; Portland, \$2.50@2.75 per bbl.

LIME.—Santa Cruz, \$2.25; Roche Harbor, \$2.25 per bbl.

LUMBER.—(Retail): Pine, ordinary sizes, \$20.00@22.00; extra sizes higher; redwood, \$22.00@23.00; lath, 4 feet, \$1.25@1.50; pickets, \$1.95; singles, \$2.35 for No. 1 and \$2.00 for No. 2; shakes, \$13.50 for split and \$14.50 for sawed; rustic, \$26.00@32.00.

NAILES.—Per keg (list prices): No. 20d to 60d, Wire, \$3.30; Cut, \$3.30; 10d to 16d, Wire, \$3.35; Cut, \$3.35; 8d, Wire, \$3.40; Cut, \$3.40; 6d and 7d, Wire, \$3.50; Cut, \$3.50; 4d and 5d, Wire, \$3.60; Cut, \$3.60; 3d, Wire, \$3.75; Cut, \$3.75; 2d, Wire, \$4.00; Cut, \$4.00. Special rates for car-load lots.

GENERAL SUPPLIES.

POWDER.—F. O. B. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15c; less than one ton, 17c. No. 1*, 60%, carload lots, 13c; less than one ton, 15c. No. 1** 50%, carload lots, 11c; less than one ton, 13c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9c; less than one ton, 11c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, 9x, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c $\frac{1}{2}$ set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 25@26c $\frac{1}{2}$ lb.; carloads, 24@24c; in 10-lb. tins, 35c; sulphuric acid, in carboys, 66% B, 2c $\frac{1}{2}$ lb.; soda ash, \$2.00 $\frac{1}{2}$ lb.; hyposulphite of soda, 24@30c $\frac{1}{2}$ lb.; blue vitriol, 54@64c $\frac{1}{2}$ lb.; borax, concentrated, 7@8c $\frac{1}{2}$ lb.; chlorate of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 34@35c; California refined, 2@2c; nitric acid, in carboys, 8c $\frac{1}{2}$ lb.; caustic soda, in drums, 3@4c $\frac{1}{2}$ lb.; Cal. s. soda, bbls., \$1.25@1.50 $\frac{1}{2}$ lb.; sds., \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c $\frac{1}{2}$ lb.

OILS.—Linsed, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 51c. Kerosene —Pearl, per gal., 22c; Astral, 22c; Star, 22c; Extra Star, 24c; Eocene, 23c; Elaine, 23c; Water White, in bulk, 16c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23c; 86° Gasoline, bulk, 21c; do., cs., 27c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22c; Lard Oil, No. 1 bbl., 95c; cs., \$1.00; Neats-foot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 56@57c; cs., 57@60c; Sperm, crude, 50@60c; Natural White, 65c; Bleached do., 70c; Whale Oil, cs., 50@55c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8c.

BISMUTH.—Subnitrate, per lb., \$1.60.

BONE ASH.—4c $\frac{1}{2}$ lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, $\frac{1}{2}$ lb., 60c.

MANGANESE.—(90% and over) $\frac{1}{2}$ lb., \$1.25.

MERCURY.—Bichloride, $\frac{1}{2}$ lb., 90c.

MOLYBDENUM.—25c $\frac{1}{2}$ gramme; 1000 grammes—24c $\frac{1}{2}$ lb.

PHOSPHORUS.—(American) $\frac{1}{2}$ lb., 80c.

SILVER.—Chloride, $\frac{1}{2}$ oz., 75c; nitrate, 55c.

SODIUM.—Metal, $\frac{1}{2}$ lb., \$1.00.

URANIUM.—Oxide, $\frac{1}{2}$ lb., \$3.50.

ZINC.—Metallic, chemically pure, $\frac{1}{2}$ lb., 50c.

ZINC.—Dust, $\frac{1}{2}$ lb., 10c.

ZINC.—Sulphate, $\frac{1}{2}$ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

Wanted, position as assayer or assistant, Jan. 1st. References. Address Box 18, this office.

Cyanide Chemist wants position. Amalgamator and assayer. Graduate School of Mines. First-class references. Address "Cyanide," this office.

Superintendent, competent assayer, chemist and surveyor, experienced in development work, wishes position in any capacity. "Seattle," this office.

Cyanids man and assayer wants position. Can take shift on mill if needed. Practical experience and reliable. C. F., Mining and Scientific Press.

Engineer wants position to run boiler or mill engine or pump. Use to combustion of oil and Corliss engines. Have recommended. Good mechanic. R. Blackwell, Elsinore, Riverside Co., Cal.

All around mechanic, 15 years' experience stationary and locomotive engineer, 5 years foreman of construction and boiler work, wishes mechanical position, or engineer on gold dredger. Address C. E. H., this office.

A sober, industrious young man desires a situation as surveyor, assayer, draughtsman and bookkeeper. Has had three years' technical training and three years' practical experience in gold and quicksilver. Am conversant with the estimation of ores and the preparation of maps and reports. Best of references as to ability and character. Address "M," care of Mining and Scientific Press.

A energetic young man, thoroughly conversant with the indications, occurrence, mining and reduction of quicksilver ore, wishes a situation as superintendent of a quicksilver property. Technically trained. Can handle men to advantage and am thoroughly acquainted with the duties of the office. All references as to character and ability. Address "Quicksilver," care of this office.

Engineer at present in field will be open for engagement Feb. 1st. Will engage with substantial people by the year as manager, superintendent or owner, or, if field is open, for lessor position, subject to advance upon results obtained. Thorough in technique and practice. Successful with men. Credentials the best. Address E. D. B., this office.

Competent and reliable technically educated man, 34 years of age, desires position with a good mining company. Has had wide experience in the handling of low-grade gold ores where economy was essential to success. Can give best of references. Address L. D. H., care Mining and Scientific Press.

Mining Engineer with twelve years' practical experience in mines and mills wants position as superintendent. School of Mines graduate. Has had extensive experience in developing prospects into shape for actual working on a large scale. Also practical cyanide manager, assayer and surveyor. Address "Engineer," this office.

Competent Millman, Machinist and Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 12 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

Wanted, position as manager or superintendent of mining property, or would accept a position as consulting engineer. Have had over thirty years' experience and can refer to some of the best known people, both on this coast and in the East. Salary not so much an object as permanent employment. Address "Mine Superintendent," care of Mining and Scientific Press, 330 Market St., San Francisco, Cal.

ENGINES, BOILERS, PUMPS, Etc.

The UNITED RAILROADS offers for sale, in good order, the following machinery:

- 2 sets of Cross Compound Condensing Engines, Scott & O'Neill cut-off, of 750 H. P. each; cylinders 39 in.—41x60 in. stroke, with direct acting air pump and condenser, Union Iron Works, builders. This firm built the U. S. warship "Oregon."
- 2 Circulating Pumps for condensing plant, Thompson & Evans, builders.
- Elephant Typo Boilers, 60 in. x 16 ft., 150 H. P. each, set independent, Union Iron Works, builders.
- Boiler Food Pumps, Thompson & Evans, builders.
- Deep Well Pump, Thompson & Evans, builders.
- Douglas Reversible Link Engine, about 15 H. P.

ALSO,

- 2 sets of Engines built by the Risdon Iron & Locomotive Works, each set consisting of a triple expansion jet condensing engine 15x24x38 in., of 550 I. H. P., high and intermediate pressure cylinders being tandem, of the Reynolds & Corliss types, and the low pressure being a cross with Myers cut-off, each set having an independent air pump division steam end 12x16 in. with Risdon Iron Works condenser.
- 2 Stirling Boilers, 250 H. P. each, drums 2 ft. 10 in. x 11 ft., and 244 tubes.
- 2 Risdon Condensers.
- 1 Circulating Engine.
- 2 Risdon Air Pumps 9x15 in.
- 1 Davidson Fire Pump 5x7x10 in.
- 2 Davidson Food Pumps No. 5.
- 1 Dow Duplex Pump 5x8 in.
- 1 Centrifugal Pump.

San Francisco, Cal.

MACHINERY FOR SALE.

FOR SALE.

- 1,000,000 ft. of standard black wrought iron pipes, second hand, in good condition, sizes $\frac{1}{2}$ to 12 in.
- 500,000 ft. of flanged wrought iron casing, size 2 to 6 in.
- 225,000 ft. of flanged threaded iron casing, size 2 to 34 in.
- 10,000 ft. of 6-in. riveted steel pipes.

ENGINES.

- One 30x60 right hand Fraser & Chalmers Corliss engine with flywheel 18 ft. dia. x 44 in. face, complete, in first-class order, ready for immediate delivery.
- Ws also have with this engine a triple leather driving belt 160 ft. (sandlee.)
- One 16x38 left hand Corliss engine with flywheel 11 ft. dia. x 30 in. face, complete and in first-class order.
- One 24x48 Wabeslook Corliss engine
- One 20x32 Wabstor, Camp & Lams double cylinder double drum hoist.

BOILERS.

- One 250 and one 450 H. P. Hazleton tripod boilers.
- Two 104 H. P. Abscondroth & Root boilers.
- Two 165 H. P. Abscondroth & Root boilers.
- Four 250 H. P. Campbell & Zell water tube boilers.
- Four 125 H. P. Babcock & Wilcox water tube boilers.
- One 75 H. P. Hsine water tube boiler.

AIR COMPRESSOR.

- One 20x24x24 National Drill & Compressor Co. air compressor.

The above items do not represent all of the machinery we have in stock. In addition, we offer you all kinds of automatic, compound and slide valve engines, ranging in sizes from 3 to 250 H. P.

Horizontal tubular boilers ranging from 10 to 150 H. P.

Vertical boilers, both submerged and full length tubes, from 5 to 100 H. P.

First-hand boilers from 15 to 100 H. P.

One Silsby first pump; besides we have single, duplex and compound pumps of every size.

100,000 ft. of first hose from the Pan-American Exposition.

Hoisting rope of all sizes.

Shafting, pulleys, belting and a full line of mill supplies.

Four turbines water wheels from 25 to 80 H. P.

WANTED.

Wanted---Foreman for Concentrating Plant, 200 tone capacity, located in Colorado. Must have ability to earn \$300 per month. Address "Mill Owner," care of Mining and Scientific Press.

Wanted, Phosphate Deposits on the Pacific Coast.

Address L. T. W., Mining and Scientific Press.

THE CALIFORNIA DEBRIS COMMISSION, having received application to mine by hydraulic process a mass of debris in the Ruth Placer Mine, near Meadow Valley, Plumas Co., Cal., draining into Small Creek which reaches North Fork of Feather River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., Jan. 5, 1903, at 1:30 P. M.

OFFICE OF GRANITE-BIMETALLIC CONSOLIDATED MINING CO.

PHILIPSBURG, MONT., October 15, 1902

Consolidation of plants and change to electric power permit us to offer, subject of course to prior sale, the Engines, Boilers, Machinery, etc., covered by the following list, at greatly reduced prices:

SECOND-HAND MACHINERY ON HAND.

ENGINES.

- 1 Fraser & Chalmers Cross-Compound Condensing Corliss Engine, 24 in. and 38 in. dia. x 60 in. cylinders, 500 H. P., with jet condenser. 1 team as above with Knowles Vacuum Pump and Condenser.
- 1 Fraser & Chalmers Corliss Engine, 18 in. x 42 in. 227 H. P. at 100 lbs., cut-off at $\frac{1}{4}$ stroke. 1 Hor. Atlas Engine, 8 in. x 12 in. 35 H. P. 1 Hor. Atlas Engine, 9 in. x 14 in. 30 H. P. 2 McIntosh & Seymour High Speed Engines 9 in. x 12 in. 30 H. P. 1 McIntosh & Seymour High Speed Engine, 7 in. x 9 in. 15 H. P. 3 Upright Engines, 8 in. x 8 in., 15 H. P.

AIR COMPRESSORS.

- 1 Ingersoll Straight Line Air Compressor, steam cyl. 24 in., air cyl. 24 in., stroke 30 in. 1 Ingersoll Straight Line, steam cyl. 16 in., air cyl. 16 in., stroke 24 in. 1 Norwalk Compressor, steam cyl. 14 in. L. P., air cyl. 16 in. H. P., air cyl. 10 in., stroke 16 in. 1 Knowlton Hor. Compressor Blower, steam cyl. 12 in., air cyl. 20 in., stroke 21 in.

BOILERS.

- 4 Hst. Tubular, 60 in. x 16 ft., 90 H. P. 1 Rot. Tubular, 60 in. x 12 ft., 70 H. P. 8 Rot. Tubular, 54 in. x 16 ft., 62 H. P. 6 Rot. Tubular, 54 in. x 16 ft., 63 H. P. 2 Rot. Tubular, 66 in. x 18 ft., 100 H. P. 2 Rot. Tubular, 52 in. x 14 ft., 50 H. P. 1 Hor. Economizer, 20 H. P.

HEATERS.

- 1 Tubular Heater, 20 in. x 9 ft. 1 Tubular Heater, 36 in. x 12 ft. 1 Tubular Heater, 18 in. x 9 ft. 1 Tubular Heater, 36 in. x 7 ft. 6 in. 1 Tubular Heater, 36 in. x 10 ft.

AIR RECEIVERS.

- 6 Air Receiver, 60 in. x 20 ft. 1 Air Receiver, 48 in. x 15 ft. 1 Air Receiver, 36 in. x 13 ft. 1 Air Receiver, 36 in. x 9 ft. 6 in. 1 Air Receiver, 42 in. x 8 ft.

PUMPS.

- 1 Knowlton Compound Condensing Duplex Plunger Pump, special pot-valve pattern. L. P., steam cyl. 23 in., H. P., steam cyl. 14 in. Dia. plungers 8 in. Stroke 24 in. Sooty vacuum pump 8 in. x 12 in. x 12 in. 1 Knowlton Compound Condensing Duplex Plunger Pump, 1 L. P. steam cyl. 18 in. H. P., steam cyl. 10 in. Dia. plungers 7 in. Stroke 18 in. Vacuum pump 6 in. x 12 in. x 10 in. 1 Knowlton Double Plunger Pump, special pot-valve pattern, 18 in. x 24 in. steam cyl., 8 in. plungers. 1 Knowlton Double Plunger Pump, same as above. 1 Station Pump, 14 in. x 16 in. cyl., 7 in. plungers. 4 Boiler Food Pumps, 8 in. x 10 in. cyl., 5 in. plungers. 3 Knowlton Sinking Pumps, 14 x 7 x 5 x 10 in. 1 Knowlton Sinking Pump, 12 x 8 x 6 x 12 in.

PLANERS.

- 1 Iron Planer, 7 ft. x 21 in. bed, plans 24 in. high, 24 in. wide, ways 9 ft. 6 in. long (Lath & Mortar).
- Tool Co., Worcester, Mass.) 1 Planer, 20 in. x 5 ft. bed, pade 21 in. wide, 24 in. high, ways 7 ft. 6 in. long. 1 L. B. Reed (Cairo, Ill.) Planer, plans 30 in. x 30 in. between uprights, 24 in. x 9 ft. 6 in. long.

LATHES.

- 1 Field Engine Lathe, swing 30 in. Dia. centers 16 ft., bed 21 ft. over all. 1 L. B. Reed (Cairo, Ill.) Lathe, swing 24 in. Dia. centers 8 ft.

DRILL PRESS.

- 1 Vertical Drilling Machine, table 30 in. dia.

BOLT CUTTERS.

- 1 Bolt Cutter, band or power, cuts pipe up to 2 in. dia. 1 Bolt Cutter, cuts pipe 1 1/2 in. and under.

DYNAMOS.

- 1 T. H. Motor, Type "E," 250 light, 110 volt. 1 T. H. Motor, 250 light, 110 volt. 1 T. H. Motor, Type "E-1," 200 light, 110 volt.

DIAMOND DRILL.

- 1 American Diamond Rock Boring Co., 115 Courtland St., New York Double cylinders 4 in. x 4 in., tube bore 1-7/16 in. Drills 1 1/2 in. hole. For steam or air.

For further information, prices, etc., address

WERNER ZIEGLER, Supt. Granite-Bimetallic Consolidated Mining Co., Philipsburg, Mont.

Second Hand Machinery.

ALL MACHINERY IS REBUILT AND FULLY GUARANTEED.

Many of the largest mines, mills and smelters are our regular customers. A good stock of all kinds of machinery always on hand. Send us your name and we will keep you posted on bargains in machinery.

WHITEHOUSE P. O., SHASTA CO., CAL.

American Engineering Works, CHICAGO, ILL.

We are pleased to have the manufacturers of the Wilfley Table mention the Overstrom Table in their advertisements, and cheerfully return the courtesy. The Wilfley Table is a good table. The Overstrom Table embodies all the good points of the Wilfley with more available surface and closer capabilities of work. That this has been fairly demonstrated we will be pleased to show any inquirers. The point is, Do you want the better table? Can the better table be suppressed? Did the Frue vanner suppress the Wilfley because there were ONCE hundreds more Frues in use? The best things come last. Already hundreds of Overstrom Tables are in use, and the users like them for the values they save (more than can be saved in any other way).

G. E. HOSE COUPLINGS WILL PREVENT WASTE OF POWER.

They are—

Durable, **Efficient,**
Absolutely Tight,
Self-Contained,
Suited to All Pressures,
No Outside Clamps.

G. E. HOSE COUPLING.

Many dollars are annually wasted by leakage in compressed air lines. If you are a user of compressed air, this coupling should appeal to you.

Steel Roll Shells.

If superintendents of Sampling and Concentrating Mills will give us sizes of shells they require we will keep stock for quick shipment of these sizes.

ROUND HOLE and DIAGONAL SLOT Perforated Metal Screens

for Stamp Batteries, Jigs, Ore Mills and Concentrators.

E Style Malleable Iron Elevator Buckets.

Ever deservedly popular.
Giving the most wear for the money.

UTAH AGENTS: UTAH MINING MACHINERY & SUPPLY CO., SALT LAKE CITY.
CALIFORNIA AGENTS: RIX COMPRESSED AIR & DRILL CO., SAN FRANCISCO.

SAVES NINE-TENTHS YOUR POWER.

The Durkee Electric Drill

uses but one-tenth the power required by air drill of same size to do the same amount of work.

COSTS ONE-THIRD AS MUCH

as other drills to install.

Is electrically driven and no electricity enters the drill, therefore the men behind the drill are free from shocks.

Has no expensive steam or air pipes to keep in repair.

Has three speeds regulated by a simple speed controller. Stroke can be regulated from 2 to 5 inches.

IF YOU HAVE WATER POWER

think what you can do:

For those starting a mine on a small scale, and who cannot afford a complete steam plant, our drills and equipment are without question the cheapest, smallest and most compact plants on the market. In cases where the mine is isolated and fuel is very high, it would only be necessary to install a small gasoline-electric engine and dynamo to generate the electricity to deliver to the 2 H. P. motor that runs the drill, to furnish incandescent lights, and power for fans to ventilate the mine. Or, where a steam plant is already installed, it would require only a very small engine to run the generator.

The Forest Reserve and the Miner.

The object of setting aside certain timbered lands as a national reserve is primarily for the purpose of protecting the timber from destruction by lumber men, forest fires or otherwise, and to thereby secure as far as possible an abundant and regular rainfall. It has been repeatedly demonstrated that a country denuded of verdure soon becomes arid. The rainfall decreases, and in time the region becomes a desert. It is apparently the desire of the Land Department to protect the miner and not to set apart as timber reserve lands more valuable for mineral than for timber. The following provisions have a direct bearing upon this subject and are of interest to miners in timbered regions of the United States everywhere:

No forest reservation shall be established except to improve and protect the forests within the reservation or for the purpose of securing favorable conditions of water flows and to furnish a continuous supply of timber for the use and necessities of citizens of the United States; but it is not the purpose or intent of these provisions, or by the Act providing for such reservations, to authorize the inclusion therein of lands more valuable for the mineral therein or for agricultural purposes.

Upon the recommendation of the Secretary of the Interior, with the approval of the President, after sixty days' notice thereof, published in two papers of general circulation in the State or Territory wherein any forest reservation is situated and near the said reservation, any public lands embraced within the limits of any forest reservation which, after due examination by personal inspection of a competent person appointed for that purpose by the Secretary of the Interior, shall be found better adapted for mining or agricultural purposes than for forest usage, may be restored to the public domain. And any mineral lands in any forest reservation which have been or may be shown to be such, and to be subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry, notwithstanding any provisions herein contained.

To determine the value of undeveloped mineral lands, even approximately, is a difficult task. A single mine or limited district may upon development produce more value in mineral than all of the timber in the county is worth, and still in its unexplored, undeveloped state there may be no marked superficial indication of great mineral wealth lying beneath the surface.

That some steps must be taken by the Government to preserve the forests of the West is apparent, but

Ahijah's Grave, Ping-yang, Korea. (See page 370)

the destruction of timber is not accomplished by miners. In a few limited areas miners have denuded the forests for use in the mines, but in such excepted cases the mineral far outvalues the timber. It would seem equitable to set aside the forests, and at the same time permit the miner to prospect for mineral and to limit him in his use of timber to that growing upon claims owned by him, as already provided in the mining law, on condition, however, that should he cut timber on adjoining Government land he shall pay for the same at a uniform rate established by the Government. It would soon be observed that as quickly as this condition obtained there would be little doubt of the superior value of the land for mineral rather than for timber, which at once places it in the excepted class.

A Model Tunnel.

There are few mining tunnels constructed on the elaborate plan shown in the accompanying illustration.

Monarch Tunnel, Idaho Springs, Colorado.

tion, which is that of the Monarch tunnel, at Idaho Springs, Clear Creek county, Colo. It is a work of art, from the standpoint of both the miner and photographer. The method of timbering shown is one commonly seen in railroad tunnels but rarely in those of mines. It will be noticed that the tunnel is unusually large, having in the timbered portion room for three tracks. It will not be many years, probably, before most excavations of this character, intended for permanent use, will be supported by steel instead of wooden frames. The steel head frame is a comparatively recent construction, but is becoming common, and steel ribbed tunnels will soon be equally numerous.

With this issue is completed the first half of the 43rd year of this journal's existence—Vol. LXXXV. Forty-three years in the life of an individual or journal means a great deal, and while with the individual with age comes a more lenient standard of criticism, it is different in the case of a publication which with increasing years is justly deemed capable of greater demands and requirements. The province and purpose of this journal has ever been creative and constructive, and it has been its pleasure and its privilege through the years to advance the standing of the great basic industry of mining which it represents. It will be found foremost in the future, as in the past, and the record of its earlier years shall be but an index of its continued usefulness. Talking of indexes, the one for the past six months, appended herewith, is illustrative of the character of this journal—comprehensive, accurate and reliable; the index is equally illustrative of the class of people who read this publication—intelligent, practical men. This index, as all the other indices since 1860, is designed for the convenience of the mining public, and it is suggested that every subscriber should see that it is bound in with his volume for 1902. Meanwhile, for the 43rd time, the MINING AND SCIENTIFIC PRESS wishes its thousands of readers the world over a Happy New Year.

There is possibly a question as to the amount of sympathy a claim owner is entitled to who has failed to perform the assessment work required by law if his claim is located or "jumped" by another. The code of ethics in the mine location business is not clearly defined outside of the United States statutes.

Can Accidents Be Avoided in Mines?

Without doubt many of the accidents which occur in metal mines might be avoided if the miners themselves were more cautious, but to the miner surrounded constantly by danger, it becomes a mere incident in his calling and he is often careless through immunity from injury. Few men are injured in mines where the danger is apparent, for then the workman is alert and takes the necessary steps to avoid injury. Men are usually injured in some new and unexpected manner, and yet the accident might usually have been avoided. There are, however, some kinds of danger that can only be avoided by closing down the mine. Among the hidden menaces which cannot be detected until too late are those of missed or "cut-off" holes in the bottom of a wet shaft where sinking is in progress. The men drill a round of holes, charge them with nitro powder, often standing above their knees in water, before the work of loading is completed. The fuses are spitted and the men are drawn up the shaft. When the smoke and gas have been sufficiently dissipated, they or the men of the next shift proceed to clean up. All broken rock is shovelled up and loose rock is picked and gadded out. The men search as carefully as possible for missed holes. It is the practice everywhere for men changing shift to make known to the succeeding shift the number of holes drilled and spit, and the number of reports counted upon blasting. It is no uncommon thing for two or more holes to go at once, though sometimes a distinct report is heard for every hole. Some holes may be cut off, by one exploding a moment sooner than the next hole, and the primer and a portion of the powder in the cut-off hole explodes, leaving a quantity of powder in the bottom of the hole that had its upper portion cut off. This is the element of greatest danger to the shaft miner and its existence is not only unknown, but usually not suspected. He proceeds to drill, possibly for several hours, cutting a number of holes without mishap, when suddenly the drill strikes the fatal "cut-off" hole and every miner knows the result. How an accident of this kind can be avoided it is difficult to say. If the men spend several hours after each round of holes, in searching for cut-off and missed shots, the cost of shaft sinking would become prohibitory, and mining would soon cease.

The conditions described here actually occurred not long since in the Lincoln shaft, Amador county, Cal., and fortunately are of rare occurrence; but looking at the situation from a business standpoint, the miner must take some risks.

Searching for Hidden Veins.

The difficulties which beset the pathway of the prospector are many. The pioneer of the desert region has many hardships and troubles, but his work, that of searching for veins, is comparatively easy, for each vein usually outcrops strongly, and may be readily traced along the surface. Very different, however, is the work of the prospector in the north country, where the mountain sides are densely covered with timber, standing and fallen, and thick accumulations of debris, overgrown with moss and underbrush, hide every vein, often several feet below the surface. The alluvials of the neighboring canyons and gulches may give abundant evidence that veins exist on the adjacent hillsides, for the placer mines may have proven this to be so, which gives an incentive to the prospector.

Sometimes in the course of placer working the miner discovers a vein crossing the gulch in the bed rock. His method is plain—he follows it into the hill, or sinks a shaft on the rim at a convenient point, but what of the searcher who has not this good fortune?

In searching for blind veins, systematic work is usually the most expeditious and satisfactory, in the long run. The first thing to ascertain, wherever possible, is the true or probable strike of the veins of the district. Ordinarily, veins in any particular district have an approximate parallelism, and the direction of strike conforms nearly with the strike of the country rock, if the latter is at all slaty or schistose. Where rocks are mostly massive, that is, not slaty nor inclined to be schistose, the vein system is likely to be complex, the strikes running in many directions. In the latter case—fortunately not the most common, the difficulties of the prospector are multiplied.

Having ascertained the strike of the country rock, which may generally be observed in the bottoms of the gulches of the district, it may be assumed that the greater number of veins coincide with this strike, and prospecting work would then be directed across this strike. The quickest and simplest way to expose blind veins on a mountain side is to sluice out trenches down the hillside, but this involves the presence of a ditch or reservoir above, neither of which are usually found in new districts. In lieu of this, excavation in pits must be resorted to. The place to begin operations is in the bank at the side of the canyon where it is exposed by the stream having cut through it. If good float is found here it should be sought at a point up the hill. If a pit dug several feet up the hillside fails to disclose several pieces of similar rock, the probability is that the ore found in the bank at the bottom of the hill did not come directly down the slope, but has drifted down the gulch from some point above with its accompanying debris. Should similar ore be found in the pit first dug, without finding the vein, another should be excavated at a higher point on the hillside. Care should be taken to note the kind of material in which the pieces of detached ore are found and particularly the height above bed rock at which it is found. If this height is found to decrease as the excavations progress up the hill, the indications are that the worker is nearing the vein. Generally, too, the pieces of float are found to be larger as the vein is approached. It is the relative height above bed rock, however, which forms the main guide. This is explained by the fact that a piece of ore detached from the outcrop of a vein, whether it be exposed on the surface or not, is, when first broken off, close to bed rock, but it slowly makes its way by gravity down the slope, a process requiring centuries, possibly, and becoming mixed with the other detritus of the surrounding rocks, some of which is finely disintegrated, forming, with carbonaceous matter, soil, the piece of ore gradually reaches an increasingly greater height from bed rock as distance from its original position is gained. This process goes on much more rapidly on a steep slope than on a gentle one.

The search for the hidden vein is simply a process of following the detached fragments up hill to the source of their origin. This is the general principle underlying the quest of minerals of all kinds where the veins are buried from sight. All trenches should be made to bed rock, particularly as the work progresses up the hill, that the worker may not be misled and pass over the vein for which he is looking.

Where no float occurs on the hillside the difficulties are multiplied, and the chance for success is greatly lessened. In such cases, the absence of float may be due to the fact that there are no veins, but some veins have a crystallized or comb structure and the outcrops disintegrate into material so fine as to attract no attention from the prospector. In the search for gold this condition is met in a measure by panning carefully for gold, and it will be found, where gold exists, it will act in much the same manner as float quartz as above described, though the quartz will rise to a greater height above bed rock in a given distance than the gold. This indicates that the prospector may have to search much further to find the outcrop by following the gold than the float.

The most satisfactory method of prospecting extensively for blind leads is by means of a tunnel with crosscuts, but this contemplates the expenditure of a large amount of capital—either money or labor, or both, and the prospector usually being only able to supply one of these essentials, does not adopt a method requiring so large an outlay. Moreover, the tunnel is only justified when the outcrop of one or more valuable veins has actually been found.

The prospector should be a close observer and a good "judge of rock," that he may distinguish the various kinds of quartz or other rock he meets, one from the other, and not be led to follow worthless rock, by being unable to distinguish the different kinds of ore. The safest plan is to crush and prospect for gold, or have it assayed if for silver or base metals.

The biggest copper producer in California, the Mountain Copper Co. at Keswick, is idle. The former employees decline to work unless the mine officials recognize the local Miners' Union. This the mine officials decline to do. Between 700 and 800 men are affected. So far the most strenuous complaints come from the merchants of Keswick and elsewhere, who find their local business considerably curtailed. There is a complete cessation of all direct and indirect industries dependent for support on the operations of the Mountain Copper Co. The situation is an exact counterpart of what has taken place some time whenever and wherever mining operations or operations of any kind are undertaken on a large scale. The thing runs its course just as an epidemic or virulent disease in the human body. One can tell just how far it has progressed by the daily accounts. In the case of strikes, because of lack of Union recognition, they invariably result as a trial of strength; and, after considerable loss, which falls on the public, matters are patched up, there is a drawn game, and work resumes till next time. In the case of the Keswick, Cal., strike no new features present themselves. It is as usual as a case of measles or varioloid. A Smelters' Union had been organized, but as yet had not been "recognized" by the employers. At the smelter a man was run over by the slag train; because of that the train employees were discharged. They belonged to the recently organized Smelters' Union. A demand was made for their reinstatement. It was refused. Thereupon a strike was ordered by a minority of the employees. Then the employees of the Iron Mountain mine of the same corporation struck in sympathy. This stopped all operations. After a while one or two or three men will be seriously hurt, possibly killed; the local Union will promptly pass resolutions of disavowal and regret as to the sad occurrence; there will be the usual outcry about these things being so sad; considerable will be said and written, much of which will be so, and then the whole thing will become a reminiscence. It seems a pity that we should progress in these matters so slowly, and that there should be so much annual loss thus occasioned, but it seems as if it is only in that way these things work out, and such occurrences as that at Keswick, Cal., are as presently inevitable as the seismic convulsions of the globe.

EXPERIMENTAL WORK is being undertaken in many mining districts with a view of working low-grade dumps of oxidized ore without crushing, or crushing as coarse as it can be shown that the process will give satisfactory results. Cripple Creek, Colo., is a locality where this is attracting much attention. A scarcity of water where it is most wanted is somewhat of a drawback to the success of the project; but this will be doubtless overcome.

Concentrates.

IN blasting tough rock cut the holes with wider bits than those used in brittle rock.

IT is never safe to use a compartment of a shaft for a manway that is also used as a hoisting compartment.

NITRO POWDERS freeze at 42° F. They are then comparatively harmless. The danger is in thawing frozen powder.

THE relative merit of high or low discharge in a stamp mill, like the number of the screens, must be determined by experiment.

TUNGSTITE is a yellowish powder or silt-like substance occurring with wolframite, as a secondary product of the alteration of the latter.

NO MACHINE DRILL works well in soft, wet ground. It will cut rapidly and make muck so fast that it requires too much time to keep the holes clear.

SEVERAL MILES of Chile gulch, Calaveras county, Cal., has been filled with the tailings from gravel channel workings to a depth of 20 to 65 feet.

THE main difference between a machine gun and a rapid-fire gun is mechanical. The former is fed automatically and the latter is loaded by hand.

THE frequent breaking of pinions in hoisting engines is due sometimes to an improper setting of the engine. If the alignment is not perfect, great strains result.

A GOOD SIZED BOULDER may be broken by placing a stick or less of nitro powder on top of it, covering it with a few handfuls of mud and firing it as in blasting.

IT is unsafe to expose a quantity of giant or other dynamite in the neighborhood of blasting operations, as the concussion is dangerous and may explode the powder.

IRON SULPHIDE (pyrite) forms in the debris at the bottom of streams, that is, in gravel, mud and sand, presumably in a manner similar to its formation in veins.

THERE is no law as to the exact location of the bell line in a shaft, but it must be placed in a position where it is always easily accessible to men riding on skips, buckets or cages.

GRIT and dust may be prevented to some extent from working into a machine drill in cutting dry upper holes, by surrounding the piston bar below the chuck with a piece of gunny sack.

THE United States mining law permits a locator to take as many claims as he pleases, without limitation, but he must perform the required \$100 assessment work on each claim annually.

IN many mines carrying zinc together with sulphides of iron, copper and lead the zinc contents is found to increase in depth. Often the zinc is associated with high values in gold and silver.

TELLURIUM is of rare occurrence, but is found in Boulder county, Colo. The ores of tellurium are not uncommon, and are found in many countries, usually associated with gold and silver.

THE Fahrenheit thermometer registers freezing at 32° above zero; boiling water at sea level at 212° above zero. The Centigrade thermometer registers freezing water at zero and boiling water at 100° above zero.

IT is never economy to make the pump, air and manway compartment of a shaft smaller than other compartments of the shaft. As a matter of fact, more room is required in the manway compartment than in any other.

A SINKING LADDER should be durable and as light as possible, in order that it may be quickly handled when necessary. Ladders supplied with rounds made from 1-inch steam pipe are more durable than those having 1x4-inch staves.

A MAN is scarcely fitted, after working two weeks as "chuck tender" with a machine drill, to assume charge of the machine and pose as an experienced machine miner, yet many do this, to which the condition of the machine promptly testifies.

THERE is nothing in the statement that a certain machine drill is superior to another machine drill for the reason that one of them "strikes so hard that it shakes the ground loose." Ground so bad that it is shaken down by the blows of the drill should be drilled by hand.

WHEN big-grade slimes float upon the surface of water in vanner boxes or tanks and can not be made to settle on long standing, it will be found that if the overflow is conducted through a pipe and discharged beneath the surface of water, the finest of sulphides will settle to the bottom of the tank.

THE conditions found in ancient river channels are identical with those found in a modern stream under similar conditions. The process of channel making was the same then as now. The laws of nature are unalterable through all time, and like cause will produce like effect through the eons of ages.

WHERE a vein has a very noticeable departure in dip from the vertical, and the vein is intersected by gulches, the apparent dip is likely to deceive the locator. The true strike of a vein is at a right angle to its dip. If the true dip can be ascertained, the strike can be easily determined with sufficient accuracy.

OWING to the clayey nature of some gravel in ancient river channels it is mined and spread out on the surface for several months to disintegrate before sluicing, by

which means a much larger percentage of gold is saved. This material often pays for a rewashing after lying some months behind an impounding dam.

WOLFRAMITE occurs under a variety of conditions, associated with tin ores commonly, and also with gold, in Lawrence county, South Dakota. Sobeckite containing 67% of tungstic acid occurs in New Zealand, associated with gold. These minerals are easily recovered by concentration, being of high specific gravity.

A "BABY" DRILL is the name given to a machine drill having a 2-inch piston. A machine of this size, or 2½-inch, works well in ground not too hard and is particularly adapted to stumping and running raises, owing to the facility with which it may be handled, weighing much less than the large 3-inch or 3½-inch machine.

THERE are numerous instances in mines carrying sulphide ores where solid granulated iron sulphide without quartz proves to be practically destitute of gold or silver, while that accompanied by disseminated quartz is rich in the precious metals. Noted instances are found in the Rico district, Colo., and in Yavapai county, Ariz.

MINING CLAIMS taken as placer must conform as nearly as possible to the surveyed subdivisions of the land where they occur. Where the ground is unsurveyed claims usually extend from rim to rim—that is, to a point on each hillside bordering the gulch, 30 feet above the water line, and for 300 feet along the creek.

A LOCOMOTIVE or firebox boiler, also sometimes called a portable boiler, is convenient and less expensive than return-flue boilers, but the latter are far more economical in the use of fuel. Firebox boilers are seldom set in brick or stone foundations, but they should be covered with some material which will prevent too great a loss of heat.

THE name "fluorine" as applied to ores of Cripple Creek is a misnomer. Fluorite is the proper name of the mineral, a combination of fluorine and calcium (fluorspar) or "tuff," as it is known in Cornwall where it is common in lead and zinc mines. Its appearance in Cripple Creek ores or elsewhere cannot be taken as an index of value.

SOME of the large chlorination tailings dumps of California are those at the Plymouth Con. at Plymouth; Barney's Works, Drytown; the Vauclaves Reduction Works, Sutter Creek; Kennedy and Zella mines, Jackson, Amador county; Utica Chlorination Works, Calaveras county, and the Rawhide and Golden Gate Works, near Sonora, Tuolumne county.

WULFENITE is a yellow mineral usually occurring in tabular crystals, or in an aggregate of grains, or else disseminated in fine scales through the rock. It is molybdate of lead and is often mistaken by inexperienced prospectors for gold, owing to its bright yellow color and heavy specific gravity. It is common in the quartz veins of Nevada, Arizona and southern California.

EUCALYPTUS is a native of Australia, but has been transplanted extensively in the western part of the United States, where it grows rapidly and appears to thrive. The timber is used largely in Australian mines, and round sticks are said to be satisfactory. Sawed eucalyptus is not as good as pine, however, owing to its changing grain. It is not as yet employed in timbering mines in America.

UNSKILLED MINERS usually prefer heavy hammers with few blows. Expert miners a lighter hammer and quick blows. The latter accomplish more work. In some Spanish-American countries the natives are often seen striking single-handed with a ten-pound hammer, having a handle 18 inches in length. These men look with disdain upon a 34-pound hammer—an implement that they think is only fit for boys.

AMONG the oldest placer deposits known to geological science are the gold-bearing conglomerates lying at the base of the Cambrian formation in the Black Hills of South Dakota. These conglomerates are found at Lead and Central City, at and near the Homestake mine; at Rockerville, in Pennington county, and in Bear gulch district, Lawrence county. These ancient placers are the result of a shore deposit and are not river deposits, like those of California.

THE cassiterite (tin oxide) found in the Bear gulch and Harvey peak regions of the Black Hills, South Dakota, occurs in dikes or veins of coarse-grained granite which cut through the mica schist of the country. Some of these dikes are more than 100 feet wide. They also contain black and green tourmalines, rose quartz, orthoclase and albite and other triclinic feldspars, white and vitreous quartz, spodumene, apatite, wolframite, columbite and other minerals usually considered rare.

THE principal mineral region of central or equatorial Africa is in the southeastern part of the Congo State, in the Katanga region. The mineral country extends southward into Rhodesia and beyond, toward the Cape. There are numerous old workings in the Katanga region, which is said to be rich in copper and iron. The natives are expert, in a manner, in manufacturing iron from the ore and making it up into various implements for domestic use and for war. Early travelers in Africa tell of the natives shooting bullets of copper ore from their smoothbore guns.

NITRO POWDER never becomes too old to cease being dangerous. It may lie around for months exposed to the sunshine, wind and rain and many changes of temperature, having a wide range, but it does not render the

powder harmless, although it may become unsuited for use as a blasting agent. A quantity of old powder which had lain out in the weather for more than a year was exploded with sufficient force to destroy everything near it by shooting a rifle bullet into it. This lot of powder formed an element of great danger, though unsuited to blasting.

PETRIFIED or silicified wood is abundant in the ancient river channels of California. The trees which grew along the banks of ancient streams have either fallen into the stream and been buried beneath the gravel, or have been surrounded by the stream of volcanic mud which swept down the canyon, enveloping everything. In this condition the trees were turned to stone (became petrified) or decayed, leaving a cylindrical hole where the tree had stood in the solidified volcanic mud and sand. Occasionally though rarely the portions of the trees have become carbonized.

WHAT is known as the Knox system of blasting is employed in quarry work and not in metal mining. The system is used to split off any desired width or length of stone from a large mass, such as often occurs in granite quarries. The method is to drill two holes about 1½ inch in diameter, 8 inches apart and extending two-thirds of the distance through the mass of rock from which the block is to be given. These holes are placed directly on the line of proposed fracture. They are charged with black powder or "low dynamite," and an air chamber or space is left between the top of the charge of powder and the tamping. The holes are fired and recharged repeatedly until the block is split along the line of desired fracture. In some cases this break will extend in a direct plane for 50 feet or more in homogeneous material, such as granite.

A CROSSCUT TUNNEL of great length to develop veins at depth is only justified when the value of the veins have been proven in their upper portions. Many promising mining ventures have been wrecked by exhausting all available funds in driving long and expensive tunnels, which failed to develop wealth before financial disaster overtook the company. Often the ore shoot is divided into irregular sections, and should the crosscut reach the vein in one of its poorer portions it might result in an entire suspension of work, where its continuation would mean success. As a general plan it is always advisable to develop the vein where values are, if not uncertain, at least where they may be proven at least expense. Later, where this expense of crosscut tunnels, or shafts through country rock is justified by actual development of the upper portion of the vein, extensive workings of the character stated are not only desirable, but it is good business to have them, as by their means the general cost of mining operations is decreased.

THERE is a way of getting water into a boiler without pumping it, where a light pressure is available. The apparatus consists of a tank, made strong enough to stand full boiler pressure, mounted above the waterline of boiler, connected to the shell by means of a pipe that discharges below the waterline, fitted with a good valve so that all connection between tank and boiler can be shut off at pleasure. This valve is shut and the tank filled with cold water, after which the supply is shut off and the valve in connecting pipe opened, thus equalizing the pressure and allowing the water to run into boiler by force of gravity only. While it is plain that no power is used in pumping water into the boiler, yet no remarkable saving is effected by it. Take a 100 H. P. boiler for example, in which case the pump would develop .348 H. P.; assuming that it requires five times as much as a good engine it would be equivalent to .348 × 5 = 1.74, or say 2 H. P. when friction is included. This is all that can possibly be saved by this plan, and as the whole power is 100 the saving cannot be more than 2%.

THE rounded, boulder-like appearance sometimes observed in rocks found in situ is not due to erosion, but to a peculiar process of oxidation and alteration known as concentric decomposition. This condition is often found at or near the surface, and sometimes in deep levels of mines, where there has been an extensive alteration of the wall rocks of the crushed rock mass within the zone of mineralization. By the process the outer portions of angular-shaped blocks or masses undergo decay, the decomposition progressing from the surface inwardly, the process seeming to develop a series of concentric layers or shells, one within the other, enveloping the nucleus, which is often but little, if at all, altered. Undoubtedly the structure of the rock, in cases where this peculiar decomposition appears, was originally concentric, a condition possibly assumed when cooling from the molten magma, but which would be unobserved were it not for the decay of the mass. In regions where this condition obtains in massive rocks, such as granite, diorite and many porphyritic rocks, the surface of the country is seen to be strewn with boulders of various sizes, from small cobbles to great masses of many tons weight, and these latter in the neighborhood of towns are often worked up into building stone or used for other purposes. The fine material which generally composes the surface in such regions is often soft and much decayed. Not infrequently many of these boulders may be observed to rest on cup-shaped shells, which are portions of the original rock mass that has resisted decay somewhat longer than the balance of the rock to which it belongs. In some mines this peculiar progress of the alteration of the original rock is observed, as at the Basick mine in Colorado, and at the Darien mine at Cana, Colombia, S. A.

An Economical Mining Method.

TO THE EDITOR:—In your issue of the 6th inst., under the caption, "An Economical Mining Method Required," your inquirer, who is striving to "round corners and polish ragged edges," may possibly find a solution of the difficulty in the very material he is troubled with, namely, the blocky waste. The description of the property which is such a problem to

Fig. 1—Supporting Loose Hanging

Fig. 3—Construction of Chutes With Waste Rock.

Fig. 2—A Retaining Wall.

the future working of the leaner ores; there was a long haul from the mines to the concentrator—over three miles; the ground was heavy, as the district had been a zone of great earth movements, forming innumerable local faultings and clefths; timber was costly, hence the greatest care had to be taken to exercise economy in every branch of the mining operations. The silver-lead deposit was in the form of a series of fissure veins in the metamorphosed sedimentaries. The foot wall of the main lode was well defined, but no definite hanging wall could be found. The mineral occurred associated with the country rock, sometimes in the form of stringers, but more often disseminated irregularly throughout the schists and vein filling. The best ore made on the foot wall.

Overhand stoping was resorted to whenever practicable. A series of raises would be put up from the main level to a height of about 30 feet, following the foot wall of the lode, and stoping would be commenced on either side along the strike of the ore body. The main drifts would be kept intact either by timbering, by building retaining walls with the lumps of dead rock broken down, or by a combination of the two. (See Figs. 1 and 2.)

As the stopes were carried up, mill holes at intervals of 50 feet and manways were built of the "deads." (See Fig. 3.) Nothing was wasted. The miners sorted all the rock broken, the ore was put into the "chutes," the larger pieces of rock stacked up by themselves for the "wallers," and the small pieces and fines made the floor of the stope. I used to keep two men doing nothing else but building these retaining walls, mill holes and manways. They were paid at the rate of 1.30 marks (about 33 cents) per square meter of walling. No cementing material of any kind was used, and if properly built, the walls stand a long time without any repairs.

Should the roof or walls of the stope become heavy, that portion was temporarily secured by means of a post and cap until a wall would be built to support it, when the post was drawn, so that practically no timber was lost by this method, and the stopes were kept in a safe condition. In nearly all cases sufficient waste was obtained to keep pace with the filling, but at times it would be necessary to get more, and this was done by cross-cutting toward the hanging wall. These crosscuts served a double purpose, in as much as they made up the deficiency of waste and explored new ground. Just as fast as the rock was broken down, it was sorted and the ore put into the chutes. None of the ore was allowed to accumulate in the stopes. The chutes were emptied as often as we were hoisting from that level. In the larger stopes I would often have as many as six gangs of men working. A raise would be put up in the middle to the height of the next stope to be carried forward, then we would work both ways to the breast, the filling being kept up with the stoping so that the men always had a good floor on which to work and sort the rock. (See Fig. 4.)

All the men were put on contract, there were no "daily wages" paid in the stopes, and our mining costs were reduced to a minimum. In the terms of the contract the men broke the rock, sorted it, trammed the ore to the chutes, made the floor of the stope, and kept the roof and walls safe. I had no trouble whatever with this system, and was able to economically extract the ore from a very difficult mining proposition.

From your inquirer's remarks, I should think that this system could be applied in his case, the main things being to keep the filling up with the ex-

mining industry. The outlook for the coming year is promising, particularly in the gold mining regions, as with rising prices for almost everything except silver, gold will be in greater demand.

The Square Set System of Timbering.

TO THE EDITOR:—Referring to MacDonald's suggestion to Woakes' inquiry relative to timbering an ore body wherein trouble is feared by reason of the vertical inclosing walls and difficulty of holding the ore in place until ready for mining, I recall some work done in the Chapin iron mine in Michigan, where great difficulty was encountered in holding the ore body up on timbers. It was then determined to let the ore "come." This was accomplished by slicing horizontally from foot to hanging walls, taking out from 20 to 40 feet wide and about 7 feet in length, using but very slight timbers and allowing the ore body to cave this height. A new slice was started after allowing the caved portion a short time to settle and become partly compacted. There was no difficulty found in having the ore cave between the walls, filling of waste rock was run in upon the top of the portion being caved. Another method of mining followed at the Norrie mine on the Gogebec range in Michigan offers some suggestions to Mr. Woakes. Here the ore body is of soft hematite, containing about 8% moisture; the ore body is practically half a mile long and in places over 300 feet wide. Square sets are used. The shafts are in the foot wall and drifts parallel to the ore body vein in the foot wall. The ore is attacked by taking out the ore from foot to hanging walls by room and pillar method, the rooms being four sets (26 feet wide), and pillars three sets (about 19 feet wide). These pillars are again cut by drifts parallel to the foot wall to facilitate tramping.

The rooms are filled with waste rock and the pillars removed by driving into their center and then to the hanging wall. When this is reached drifts to the right and left are started and the ore removed by drawing back. When the hanging shows signs of caving the entire face is lagged up and miners are withdrawn until the cave has taken place. After an interval of, say a week, the men again attack the ore by going to the caved face and working behind the cribbing and fallen rock. By this method the miners are constantly protected from falling material and have solid ore on their right and left.

It seems to me that by following Mr. MacDonald's suggestion there would be only the one place for men to work, namely, around the two-compartment up-raise. The room and pillar system filling the rooms with waste affords a number of faces to workers. Now that the costs for this work are not exorbitant is shown by the fact that for years of the panic of the '90's the ore from this mine was not worth more than \$3 per long ton on the cars. I am not acquainted with all the difficulties that faced Mr. Woakes when mining his ore body, but the foregoing suggestions are offered as methods whereby soft ore bodies may be safely and economically mined.

RICHARD A. PARKER.

Hot Springs, N. M., Dec. 18.

The Pertencia.

In Mexico the "pertencia" is the unit of measurement in mining claims, comprising 10,000 square meters. The law requires that it shall be square where possible, but must in any event contain the full amount unless it shall be a fractional claim, surrounded by others. The boundaries are vertical

your contributor, is altogether too inadequate to allow of any real advice being given, but an outline of the method I employed while mining a low-grade silver-lead proposition in the Lower Hartz, Germany, may act as a guide, or suggest some scheme for the handling of the property in question.

We had at the Neudorf mines, Anhalt, Germany, many difficulties to contend with. The mines had been worked a number of years, the richer portions had been worked out, no heed having been taken for

cavation, get the ore into the chutes as quickly as it is broken down, and utilize the larger pieces of barren rock for building the chutes and manways.

FRANK H. PROBERT,
Consulting Mining Engineer.

230-31 Bradbury Bldg., Los Angeles, Cal.

THE statistics for the year now drawing to a close will show an increased activity, with a material augmentation of output in almost every branch of the

Fig. 4—Stope Showing Chutes.

planes and there are no "extralateral rights"—a distinguishing feature of claims in the United States and the most prolific source of mining litigation. The pertencia does not convey with it any right to surface ground, being in the form of a right to mine only. The owner of this privilege pays \$10 annually in Mexican money to the Federal authorities, and in the event of failure to pay he is given but ninety days grace, at the end of which time he forfeits his pertencia if the tax still remains unpaid.

The Experiences of a Working Miner.

Written for the MINING AND SCIENTIFIC PRESS.

You may remember that two or three years ago I sent you some of my experiences among the mines. Well, since then I have had other and different experiences, and perhaps some of them may prove interesting and possibly also instructive. I know miners have to be handled with gloves—some of them not the four-ounce variety, but fine kid gloves. I know a miner, and a good one, too, who has been foreman for several years of a large and very interesting gold mine in California. He is not a student, in the ordinary acceptance of the term, but he studies his mine and understands it well. One day a noted geologist visited the mine and in company with the superintendent spent several hours underground. The vein phenomena of this mine, the W—, at S—, is of great interest to the student of geology, and the stranger being an ardent and capable student of dynamic geology, found much to interest him and abundant food for thought.

The foreman, who has an eye to the economic branch only, accompanied the party for some time and finally left in disgust, finding some excuse to get away.

I saw him shortly after and he said: "That professor is the strangest man I ever saw. Damme, he stood and talked for an hour about a little stringer that cuts out into the hanging, when here was a fine vein 25 feet wide—all good ore, an' he never looked at 'en. Talked about ore deposits and genesis and such. Now, I've read Genesis myself, and I'll swear I never saw a word about ore deposits in the book."

* * *

I had a long talk one day with S—, superintendent of the U— mine in C— county. I had known him for some time and expected to get some authentic information concerning the mine—something everybody in the district was anxious to get. This man told me he had been placed in a most unenviable position, having "to work out the tail end of a gutted and badly worked mine. Had to get what he could from the several caved portions and to mine wherever he could find a little pay." All this sounded straight enough, but was not in line with certain other things that had come to my notice, such, for instance, as the building of a new and very expensive hoisting plant at a deep and well equipped modern shaft. It was not known to be the policy of the owners to go to such extraordinary expense to work out the "tail end of a gutted mine." The mine is still in operation and is doing well, new ore bodies having necessitated the elaborate equipment. I merely considered the remarks of the superintendent to me to be a mild form of rebuke for presuming to ask about matters that really did not concern me, although it always seemed to me he could have made the interview shorter by telling me it was none of my business.

* * *

There are mine "supers" who occasionally show appreciation of the efforts or knowledge of the men in their employ by giving them a small increase of pay, and there are men who are the recipients of favors of this kind who cannot stand prosperity of this sort. T— was one of the gang working in the big cut at the B— mine. The superintendent directed T— to look after the men on this job, to see that they were not injured by falling rock, etc., and for this T— was to receive a small additional sum per day. T— almost immediately assumed the airs of general manager and became "bossy," which was not exactly the intention. T— also put in a good portion of the time sitting down and found much solace in his pipe while he watched the rest of the gang at work. I never asked T— whether or not he knew how it was he was sent to the office to "get his time," instead of being made "super."

* * *

B— put in an extensive, and incidentally, expensive plant at L— to work tailings by a newly discovered method. Numerous experiments in the laboratory had been made and these were said to be eminently satisfactory. When the plant was put in operation, however, the mead of satisfaction was ridiculously below par. B— then admitted that his laboratory experiments were not all that could have been desired, but he had hoped to be able to correct deficiencies in the process when operating on a commercial scale that he had been unable to remedy in the experimental work of the laboratory. Ordinarily the laboratory results are more satisfactory than those obtainable in a large plant, and there are few who have confidence in their resources to such an extent as to expect, or to hope, that shortcomings of the process in the laboratory are to be remedied in the commercial plant.

* * *

Not long since I visited B— O— district and found the camp sinking into quietude after a regular boom. I had never thought much of the camp in former days, and I was interested in learning on what the "boom" had been built. Briefly, on noth-

ing. There were veins enough, but values were low and scattering. A score of holes had been sunk, some of them equipped with good hoisting plants, and one outfit even had a mill with no ore. Many thousands of dollars were wasted. There is one good mine in the camp and one only. On one dump I found 300 tons of worthless glassy quartz neatly piled, a door barred entrance to the tunnel, and a conspicuous notice on the door read "Positively no talking with the millman." As the property was not equipped with a mill it is safe to say that the notice was not posted by the management. Whatever might have been said by the "millman" could scarcely have damaged the property.

Utah's Irrigation Pumping Plant.

Written for the MINING AND SCIENTIFIC PRESS by C. W. ARTHUR.

The irrigation pumping plant at the outlet of Utah lake, Utah, one of the largest, if not the largest pumping plant in the world, is completed. This plant was built by several canal companies controlling the waters used for irrigation purposes in the Great Salt Lake valley.

Utah lake is 30 miles from Salt Lake City and covers an area of about 375 square miles. Its principal source of supply is the streams flowing from Spanish and American Forks and Provo canyon, together with a few smaller streams which only flow

potential of 16,000 volts, to the motors at 500 volts, through three Westinghouse step-down transformers of 170 K. W. capacity each.

The pumping plant is about 300 yards from the lake outlet. A new channel has been cut from the river, and the pumps placed directly in the channel on a platform having piles as a base. A dam was constructed across the stream, the pumps raising the water in the river at their outlet about 3 feet higher than it was at the intake. Six gates, west of the pumps, prevent the water from flowing back into the lake. These may be raised when the lake level is higher, so that the river may take its natural flow.

At the time that the first two pumps were installed in the early part of August, the river's flow was little more than necessary for the farmer's domestic requirements. An official measurement of the lake recently made gave the level at 3 feet, 9 inches below compromise point, which is 3 feet, 1 inch below low-water mark. Mr. J. Holdsworth, who has taken the measurements for the past three years, says but for the pumps the bed of the river would be dry.

The pumps are supplying water for 20,000 to 30,000 acres of land which would be practically worthless were it not for the Utah lake supply. It is estimated that the partial saving of the beet crop, the making of a third crop of alfalfa, and the saving of trees in Salt Lake county this season has almost paid for the pumps.

The practical success of the pumps is not doubted,

Pumping Plant at Utah Lake, Utah.

during the spring months. Its only outlet is the Jordan river which flows through Salt Lake City, emptying into Great Salt lake.

By agreement of owners of lands adjoining Utah lake the several canal companies have acquired the right to raise the waters of this lake 3 feet, 3 inches above low-water mark, known as the compromise level. At present the water in the lake is lower than at any time in its known history, and as a result is inadequate to the demand made by the farmers upon the several irrigation canals.

Forseeing this during the irrigation months, and to save several thousand acres of this year's standing grain, the Utah & Salt Lake Canal Co., the South Jordan Canal Co. and the North Jordan Irrigation Co., who take water from the west side of the river; the East Jordan Irrigation Co. and the Salt Lake Corporation (representing the Salt Lake Canal companies, the latter supplying the city of Salt Lake), taking water out of the east side of the river, decided to build a pumping plant at the head of the Jordan river for the purpose of pumping the waters of the lake into the Jordan river, thus giving the several canal companies sufficient water for the farmers of Salt Lake valley. The above companies for years have been joint owners in Utah lake, and that right has the sanction of court by right of long usage.

The plant as constructed consists of four 40-inch double-suction, special low-running, centrifugal pumps, of the Byron Jackson type, fed with a Y. P. suction of 40 inches diameter, terminating in a 48-inch discharge. Each pump has a discharge of 100 cubic feet per second, under a 5-foot, 5-inch head. The pumps are primed by a vacuum pump driven by a 5 H. P. motor. Each pump is driven independently by a 100 H. P. Westinghouse, type "C" induction motor, operated at 530 revolutions per minute, provided with auto-starters. Power is furnished by the Salt Lake City Water & Power Co., whose plant is 12 miles distant. The current is transmitted at a

and harring the institution of an injunction suit, threatened by the owners of land bordering the lake, the beneficial effect of providing a largely increased flow of water from the canals will be felt by all the farmers in the valley.

The city of Salt Lake is to pay 25% of the cost of the plant, to provide for the wear and tear of the machinery, the amount thus paid to apply on the purchase price of the plant. The city is also to pay one-fourth of operating expenses, about \$2000 per month, and interest on the investment—the city to receive one-fourth of the water pumped into the Jordan.

The work of construction was under the supervision of F. P. Kelsey, engineer for the canal companies, F. Langsten in charge of the construction of plant, and T. E. Daniels, electrical engineer for the power company. The total cost of the plant is \$50,000.

Iron Ore Shipments.

The total iron ore shipments from the northern lakes will probably exceed 25,000,000 gross tons for the year. This will be double the business of so recent a year as 1897, and equals all that was shipped from 1855 to 1884. It is a larger percentage of the total ore production of the United States than ever before, except in 1899, and is 74% of the whole mined in the country. There will be, it is estimated, a total of about 35,000,000 tons of iron ore mined in the United States this year. Of the whole amount shipped that from Minnesota will exceed 15,000,000 gross tons. The increase in iron ore shipments this year is the greatest in the history of the State. The total shipments last season were 10,790,953 gross tons. Minnesota has five mines whose aggregate shipments this year will show a total of nearly 7,000,000 tons. These are the Adams, 1,250,000; Stevenson, 1,400,000; Mountain Iron, 1,500,000; Mahoning, 1,025,000, and Fayal, 1,800,000, gross tons.

A Study of Amalgamation Methods, With the Object of Avoiding the Loss of Mercury.*

NUMBER II.

By MICHAEL BUSTAMANTE, JR., M. E., City of Mexico.

II. THE PATIO PROCESS.—Subsequently, I had occasion to occupy myself with the treatment of ores by the patio process. The ores consisted of a quartz mass, carrying a mixture in variable proportions of miargyrite, polybasite, silver glance, pyrites, oxides of iron and manganese, and finally some native silver and calcite; zinc blende was occasionally present.

The plant comprised 50 stamps of 850 pounds; 30 arrastras; 4 mechanical washers; a patio (yard) with a capacity of 1360 tons; and corresponding apparatus, operated by abundant hydraulic power.

All the theories known to me regarding the reactions of the patio process are inconsistent with the phenomena observed in practice. As a consequence, the process, empirically, and more or less ignorantly, performed, has often been unfairly discarded by reason of failures due in reality not to its principles, but to its improper application.

Frederick Sonneschmid, who was sent to Mexico by Charles III of Spain, with the idea of introducing there the German methods of treating silver ores, did not hesitate to report that the patio process was superior to the barrel amalgamation developed by Born and his successors.

Sonneschmid assumed that the magistral, in which he regarded the copper sulphate as the chief operative reagent, liberated from the salt hydrochloric acid, which transformed to silver chloride the metallic or sulphuretted silver contained in the ores; and that this silver chloride, in the presence of the excess of salt or hydrochloric acid, was reduced to the metallic state, and amalgamated with part of the mercury, giving up its hydrochloric acid to another part, to form mercury chloride. In addition to the mechanical loss of mercury in the process, there was thus a double chemical loss, due to the formation of mercury chloride, partly by the hydrochloric acid from the silver, and partly by the free hydrochloric acid in the mass.

This theory, as further developed, but not essentially changed, by Karsten, and Rammelsberg and Regnault, has been generally adopted. Up to a certain point, it explains the most important phenomena of the process.

The consumption of mercury in this process is generally measured in its proportion to the amount of silver obtained. A loss of 12 ounces of mercury per mark (= 8 ounces) of silver extracted is generally considered good practice; and it is commonly reckoned that of the 12 ounces, eight constitute the chemical loss, and four the mechanical. But when docile ores are intelligently and carefully treated, the loss of mercury may be less than 3.25 ounces per 8 ounces of silver—a fact which disproves the theory that the silver chloride is reduced wholly by the mercury—since this loss is much smaller than the chemical equivalent involved in such a reaction.

Experiments made in 1878 at the Hacienda de Regla, by my father, Eng'r Miguel Bustamante, showed that when the quantity of salt was augmented, and the treatment was slightly "cold," the total loss of mercury never exceeded 4 ounces per mark of silver extracted.

By another series of experiments, made to ascertain the influence of impurities of the sulphate of copper employed, he demonstrated that the English sulphate of copper, the purest used in Mexico, did not give as good results as the acid sulphate of copper produced by the Mints in treating gold; and, finally, that the most effective and economical of all is the impure sulphate of copper, with a large quantity of iron, known as "magistral," and obtained by the roasting of chalcopryite.

These results, repeatedly confirmed by myself and others, likewise contradict the generally admitted principles and theories cited above.

The fact is, that some of the reactions pointed out by theoretical chemists take place; but there are a multitude of other reactions which may and do also occur; and the necessary ingredients of the ore have no less (and probably even more) influence in the patio than in other reduction methods, because the latter may neutralize, by means of appropriate mixture of charges, some of the elements disturbing the desired reaction; whereas in the patio no one has taken pains to make such mixtures, but all are content simply to divide the ores into "docile" and "rebellious."

This is not surprising, since the greater number of plants are in the hands of ordinary amalgamating workmen, ignorant of chemistry and mineralogy, and attached to the routine practice of their fathers. Regular dokimastic assays are rarely maintained, and still more rarely used with advantage as checks or guides in daily operations. The assays of the residue are carelessly made, and the treatment is generally guesswork. Nevertheless, the general results

in treating "docile" ores are good. If the loss of mercury could always be kept down to 4 ounces per mark of silver obtained, and the extraction of silver and gold up to 95% of the assay value, and if this could be done with a larger proportion of the "rebellious" ores, the patio would be the ideal method of this country.

Some ten years ago, as a student of metallurgy, I presented, in my examination thesis, a theory of the patio process which I wish now to re-state, without pretending that it solves the whole problem, but believing that it takes account of certain reactions, constantly occurring in the process, which have been overlooked hitherto, though they have a marked influence on the result of the treatment.

The first chemical operation upon "docile" ores is the salting (ensalmarar), which consists in the addition of chloride of sodium (from 1.5% to 4% of the weight of the ore). The salt should be as pure as possible, as its quality has a marked influence on the consumption of sulphate of copper afterwards, and on the pureness of the silver, as well as on the time spent in making up the torta.

In the majority of cases I have found the use of an excess of nearly pure salt to result in greater silver extraction, saving of time in the treatment, and notable diminution in the loss of mercury.

After the mixing (repaso), which may be done by peons, horses, rollers, pans, cradles, Archimedean screw, Chilean alacran, arrastras, etc., comes the "incorporation" of the sulphate of copper, or the magistral, and then of the mercury. The quantity of copper sulphate added (varying from 1.5% to 6% of the weight of the ore) depends upon many circumstances, the principal being the dullness of the workmen and the good or bad quality of the impure sulphate employed. The quantity of mercury added is calculated to be four or five times the weight of silver expected to be obtained at the end of the operation.

(TO BE CONTINUED.)

Losses of Gold From Zinc Precipitate.

TO THE EDITOR:—In your edition of Nov. 8th you reprint a paper of mine read before the Institute of Mining and Metallurgy, and, as considerable advance has taken place since then in the practice of the process, I should like to point out that the method of cleaning up precipitate suggested by me in that paper is now very much simplified by the use of a special filter press. This enables the contents of the precipitate boxes, after the zinc trays have been withdrawn, to be transferred direct into the filter press, and the washed cakes are ready for fusing direct, or for acid treatment, or roasting, without having once been touched by hand.

The filter press has a lining of ordinary paper over the cloths and the latter do not thus come in contact in any way with the gold precipitate. The cake is lifted out in the frame protected by the filter paper on either side, without transference to any other vessel whatsoever.

The object of my paper was to sound a note of warning as to the heavy loss incurred in running down precipitates by the methods usually followed. The operator in charge of a cyanide plant is not usually in the position to determine his loss for himself, as he can take no risk of any experimental treatment, which would result in his being unable to account for the amount of hullion claimed from him.

On the other hand, it is desired, except where the precipitate is shipped to the smelters, that the hullion recovered should be pure, and thus recourse has been had to the use of niter, dioxide of manganese and other oxidizers without accurate experimental determination of the loss involved by such treatment.

If any cyanider will divide his precipitate into two accurate halves, and run down one-half by the ordinary methods and the second half by reduction with litharge and subsequent cupellation of the lead ingot, he will be surprised at the amount he saves by the lead method above that returned by the ordinary clean-up process.

In a letter to the Johannesburg Mining Standard, in 1899, I pointed out the importance to the industry of saving the large monthly loss resulting from the method of cleaning up employed, and suggested that the powerful corporations there should investigate the matter and determine the standard method of reduction involving the least loss, and this suggestion was also advocated in the editorial on the subject. The suggestion was at that time not acted upon—perhaps, owing to the war—but I do not doubt that within the coming year methods involving acid treatment or oxidation of slimes will be relegated to obscurity there, in favor of some method more closely approximating to the assay of auriferous matter—for instance, fusing with litharge.

London, E. C., Dec. 3, 1902. ALFRED JAMES.

The comment made on the letter of Mr. James to

the South African Mining Journal, April 8, 1899, was as follows:

The attention of cyanide workers is drawn to an important letter from Mr. Alfred James upon the serious loss resulting to the Witwatersrand mining industry in cleaning up the gold from the cyanide treatment. When such loss is estimated by Mr. James himself to run from about 1% to 6% of the whole output from this source, and when a practical and responsible metallurgist on these fields (Mr. Leonard Holms of the Consolidated Gold Fields) fixes the average loss of some 6%, when also a loss of merely 1% is equivalent to a yearly £50,000, increasing proportionately with the output, it is very clear that the suggestion conveyed in the letter—that an organized inquiry be made by the leaders of the industry in the shape of a series of tests on actual working scale—is of the utmost moment.

How and Why the Injector Works.

E. A. Rhodes, in the Practical Engineer, writes entertainingly of the injector. He says: The operation of the injector does not involve any principle of a perpetual motion, and is not doing work without consumption of power. Mr. Forney, in his book, "Catechism of the Locomotive," states the principle in substantially these words: Steam escaping from under pressure has a much higher velocity than water would have under the same pressure and condition. The escaping steam from the receiving tube unites with the feed water in the combining tube and gives to this water a velocity greater than it would have if escaping directly from the water space in the boiler. The power of this water to enter the hoiler comes from its weight moving at the velocity acquired from the steam, and it is thus enabled to overcome the hoiler pressure.

He then goes on to illustrate this by the example of a wooden croquet ball, which will float on the surface of the water, but if thrown violently into the water it will sink before its buoyancy will overcome its momentum, while a very light hollow ball will not sink, no matter how much force we may expend in throwing it into the water, because its momentum or actual energy is much less than is that of a solid ball. If steam were not condensed it would not have sufficient energy to overcome the hoiler pressure.

Another writer, Sinclair, describes the principle very nicely in the following language:

The principle of the injector's action is that of induced currents. A current of any kind has a tendency to induce a movement in the same direction of any body it passes over or touches. Thus we are all familiar with the fact that a current of air (called wind) passing over the surface of a body sets waves into motion.

In the same way a jet of steam moving rapidly when injected into a body of water, under favorable conditions, imparts a portion of its motion and starts momentum sufficient to overcome the original pressure of the steam. That is how the injector is made to force water into a hoiler against the same pressure the steam is starting from. There are many other applications of this principle, the most common of which are the ordinary locomotive blast, blowers, steam siphon, steam jets, jet exhausters and Argand burners.

Closely examined, its mystery as a source of power disappears; for it is found that an amount of heat equal to the mechanical equivalent work done is used up during the operation of feeding.

Thus, when a given quantity of heat units pass from the throttle to work the injector, the whole of the heat does not return to the hoiler along with the feed water, as was at first supposed to be the case, but a portion of the heat representing the foot pounds of work done is dissipated, besides other losses due to leakage, radiation and connection.

There are many forms of injectors in use, but all of them conform to the above elementary principles in their mode of action.

In the cut steam enters from the hoiler, passes through the steam pipe and receiving tube, S, at a high velocity, and, combining with the water at point W, condenses, but imparts considerable momentum

to the water which rushes along into the delivery pipe, raises the check valve and passes into the boiler. As the current of water for starting the injector could not be induced against the constant pressure on the check valve, which equals the pressure at the throttle, an overflow is provided, when the water can flow unchecked until the necessary momentum is obtained, when the overflow is closed.

Mine Timbering in the Old Ironsides and Knob Hill Mines.

NUMBER II—CONCLUDED.

By H. P. DE PENCIER, McGill University, Montreal.

One-inch manila rope is used on the drum, with a single-pulley block fastened to the timber of the upper floor; the end of the rope is fitted with a pair of steel hooks for hoisting caps and posts; lagging is tied together and hoisted in lots.

Timber is moved about the upper floors by means of a pair of steel tongs like ice tongs.

As yet no reinforcing sets have been used. Heavy ground is held by putting in diagonal braces, or by extra spragging and cribbing with solid timber cribs built in between the rock and the regular sets to prevent a fall beginning.

In the center of the large stopes cribs filled with waste rock or in some cases with ore are carried from the bottom level up with the timber; this is intended to steady the timbering in the stope. This filling timber is usually 15 or 20 feet square and is retained by large lagging split and placed behind the posts.

Where a turntable is put in the track in the bottoms of stopes a post is left out at opposite corners to allow of long timbers being turned; an 8x8-inch upright is bedded on rock beside the adjacent posts and a 12-inch square timber on top of these supports the regular caps.

On the bottom of the stopes chutes for drawing the ore from the floor above to the mine cars are built in every 15 or 20 feet along the tracks; they are built of 6-inch plank, the mouth is 5 feet above the track and 26 inches wide.

Very little timber is used in drifts and crosscuts, only a few square tunnel sets resting on sills and measuring 4x7½ feet are used.

In winzes and raises stulls are placed across in the usual way to support the platforms and ladders. Ladders are 10 feet long, sides 3x4 inches, rungs 4x1½ inches, 18 inches long and 8 inches apart.

From an underground station in the Knob Hill a vertical shaft over 200 feet deep has been sunk. The frame is made of 8x8-inch round timber; the posts of the gallows-frame are 12-inch square timber; no braces are required, as the tops rest against the rock. The station is lagged with 2x12-inch plank. The foundations are mudsills, with two long sills beneath the hoist. The chamber is dry, and no better roof is required.

A small car is used, running on a 30-inch gauge track, and a small hoist run by air pulls it up the incline, when at the proper place it dumps its load automatically into the movable chute below, which throws it into the railway car standing alongside. The whole hoist rests on mudsills, and can be turned to face different parts of the bank from which the ore is being taken. It is steadied by guy ropes reaching from the top to any convenient anchor.

On the whole, very little timber is used on Knob Hill, a few tunnel sets being practically all, outside of winzes, chutes and underground station. The tunnel sets are 10 feet wide by 7½ feet deep, California sets.

Timber used in Knob Hill may be used repeatedly until worn out; but the life of timber in Old Ironsides is not expected to be more than three or four years, on account of the water and great quantities of powder smoke.

A timber crew in the Old Ironsides consists of four men, of whom two at least should be experienced men, the others may be laborers; but more expeditious work can be done if they also have had some experience. The speed of erecting stope timbers depends on the location and the condition of the place where they are being put up, if far from the timber stores or near, and whether there is much rock in the way or not. Generally, from six to twelve square sets of three pieces are put up by each crew in eight hours.

Tools required by each crew consist of two sharp axes, two older axes, 6-foot crosscut saw, hooks, crowbars, hammers, picks, shovel, spirit level, straight edge, and a few drills, besides tools used about hoisting engine.

The framing carpenters on the surface require cant-hooks, 8-foot crosscut saws, handsaws, adzes, axes, squares, templates, straight edges, plumb bobs, chalk lines, grindstone and whetstone. As a rule, the underground tools are sent to the surface to be sharpened.

The regular timbermen get \$3.50 for eight hours shift, laborers \$3; and the foreman who looks after the crews gets \$4. The framing carpenters get \$4 per day, but work ten hours per day.

Figures of the cost of mining have not been made public. Any attempt to figure the cost of timbering in a mine must be made from figures got during a period when the conditions have been very nearly the same; as this has not been the case here, owing to changes in the labor and in the source from which the timber has been got, the figures would be of little use.

The drawings of timber were made by the writer from measurements and notes taken by him at the mine.

Electric Storage Battery Locomotives.

The electric storage battery locomotive is an efficient and convenient agent in the economical banding of material about industrial plants.

There is not a manufacturing plant, but what could with profit seriously consider the question of the eco-

and what saving could be effected by the adoption of modern methods. For years about many industrial plants material has been moved from one department to another by means of wheelbarrows and trucks, but as new buildings have been added to the plants from time to time, and the area over which the buildings extend has been increased, the handling or moving problem has not in most industries been given the attention it deserves.

The Jeffrey Manufacturing Co. of Columbus, Ohio, claim they were the pioneers in the building of storage battery locomotives. For a number of years this company had been building electric locomotives operated from trolley wire and third rail for use in and about mines, and their attention was first called to the desirability of bringing out a small storage battery locomotive which could be readily operated in coal mines for the placing of empty cars at the face in the rooms and hauling out from such rooms loaded cars. It was impractical, due to expense and inconvenience, to carry trolley wires into the rooms in the mines, so they started a line of experiments looking towards an economical and efficient storage battery locomotive for this work with success.

Perhaps the most interesting locomotive shown in the illustrations is the one which is being used about the plant of the Jeffrey Manufacturing Co. at Columbus, Ohio (Fig. 1). The weight of this locomotive is about twelve tons. It is equipped with two trucks, each having four drivers driven through flexible connections by one motor. The battery is arranged in two sections, each being supported on a truck. A cab for the operator is provided, and in this are located all necessary instruments, switches, controllers, etc., both for charging the battery and operating the motor. The first of these locomotives to be built and put in use by the Jeffrey Manufacturing Co. has been in constant service about their plant for over two years, and the expense of the operation and maintenance, they say, has been practically nil.

Some of the accompanying illustrations show the storage battery locomotive with trolley attachment. It has been so built in order that, where it is convenient, a trolley line can be strung along a portion of the track over which the locomotive operates so that the latter may be charged while running over such section. Other methods for charging have been devised, such as arranging for regular charging stations where it would be convenient to locate charging plugs; also so that one battery can be quickly removed from the locomotive and a freshly charged one put in its place.

Fig. 2 illustrates an electric storage battery locomotive used in gathering coal from rooms in mines. The cut shows the engine being charged. Figs. 3 and 4 show storage battery locomotives used at the De Lamar copper refining works, and Fig. 5 illustrates a twelve-ton storage battery locomotive hauling train of cars in the Jeffrey Manufacturing Co.'s plant.

Useful Notes for Electrical Engineers.

A little handbook recently issued by the National Boiler & General Insurance Company, Limited, London, gives the following useful notes for electrical engineers: Maximum permissible temperature of dynamo and motor coils, 150 degrees to 160 degrees Fahrenheit; watts = volts × amperes; 1 watt = 441 foot-pounds per minute; 746 watts = 1 horse power; 1,000 watts = 1 kilowatt; 1 horse power = 0.746 kilowatt; 1 kilowatt = 1.34 horse power; 1 Board of Trade unit = 1 kilowatt for 1 hour; 9 to 10 sixteen-candle power lamps require 1 horse power; 1 sixteen-candle lamp at 100 volts takes 0.48 to 0.6 ampere; efficiency of small dynamos, about 85%; efficiency of large dynamos, about 93%; efficiency of steam dynamo sets, 70 to 75%; 1 kilowatt requires from 1½ indicated horse power to 2 indicated horse power to generate it. Keep damp, dust and oil off wiring and insulation. Electric driving is often suitable for scattered or intermittently loaded machinery.—*Electrical Review.*

THE paternal nature of the Mexican Government is evidenced in the fact that native Mexican miners employed by Americans in Mexico often receive far less than Americans or other foreign miners, though when educated to it the Mexican miner is not vastly deficient. The Mexican miner's wages are fixed in certain cases by the Government, as at Cananea, where foreign miners receive double the wages paid natives. The idea of this appears to be in the event of the fact becoming known that high wages prevailed, Mexican miners would go there in great numbers, to the disadvantage of other mining sections of the republic and Cananea would be overstocked with labor.

MECHANICAL draft for the boiler equipment of the St. Louis Exposition power plant will have the unusual feature of combining forced draft and induced draft. The plant will comprise twenty-six boilers of 200 H. P. each. There will be four forced draft fans of the full housing type and 160 inches in diameter. After the gases pass through the boilers they will enter two induced draft fans, 230 inches, or over 19 feet in diameter.

nomical moving of raw and finished material from one building or department to another. Unfortunately there has not been sufficient attention given to this item of expense, and it would undoubtedly surprise many managers of industrial plants if they actually knew what percentage of the cost of manufacturing material was chargeable to this unproductive labor

"King Solomon's Mines;" or, The Land of Ophir.

Written for the MINING AND SCIENTIFIC PRESS by WILLIS G. DODD.

I note in a recent dispatch that "Dr. Carl Peters, the resolute little explorer, has returned to London from East Africa with new proofs of a theory that is of great popular interest, for it directly concerns the Bible, the theory referred to being that the district between the Zambezi and Sabi, stretching from the Indian ocean almost as far back as Bechuanaland, including a part of Portuguese East Africa and most of Rhodesia, was King Solomon's Klondike, or the land of Ophir; and the doctor has pieced out, step by step, this wonderful story in a manner that would do credit to Sherlock Holmes."

The Chinese have a proverb which says, "Gold can make a blind man see," and it is not impossible that Dr. Carl's East African interests may have influenced his discoveries.

King Solomon's mines, or the geological location of the land of Ophir, is an interesting subject to mining engineers, regarding which in recent years there has been much speculation. All that is positively known concerning the land of Ophir is to be found in the Bible, particularly in that portion descriptive of the preparation for and the building of that magnificent temple by Solomon which was erected to God and dedicated to His Holy Name.

The first mention of the land of Ophir is to be found in the Biblical account of the division of the then known lands of the earth, among the descendants of Noah, in which account we are told that the sons of Jektan, among whom were Sheba and Ophir, had their dwelling place "from Mesha as thou goest unto Sephar, a mount of the East." (Gen. X-XI.)

This allusion to a point of the compass was made with regard to some well-known locality or established central point or landmark, and as this division of the land took place during the later years of Noah's life, the landmark referred to was without doubt Mount Ararat, upon which the ark rested after the flood, Lat. 39 N., Long. 44 E. The land of Ophir, therefore, must have been located somewhere between the 35th and 45th parallels of N. Lat. and to the eastward of Mount Ararat.

In this connection it may not be out of place to say that it is very probable the term "Ophir" in King Solomon's day was used in much the same sense as we to-day use the term "Orient;" however this may be, the Bible furnishes us with sufficient data from which the mines of Ophir may be located with reasonable certainty.

For the purpose of obtaining gold and other material with which to garnish and decorate the temple, King Solomon built a fleet of ships at the port of Ezion-geber, close to Eloth on the Red sea. Hiram, king of Tyre, furnished to Solomon servants and shipmen who had knowledge of the seas, to accompany the servants of Solomon in these ships to fetch gold from Ophir. Three years were consumed in making the round voyage, and "they came to Ophir and fetched from thence gold, four hundred and twenty talents (\$27,533,000), and brought it to King Solomon, with a great plenty of algar trees (camphor wood), precious stones, ivory, and apes and peacocks." This account does not give the exact sailing course of this fleet, but from the cargo brought back it is not difficult to trace it.

Ceylon and Burmah have in all ages been noted for their precious stones; India for its sacred apes; Siam for its ivory; China the home of the peacock; Formosa and Japan for algar trees or camphor wood; and for gold the Manchurian peninsula, known as Korea, or the home of the hermit nation, situated to the northeast of China between Lat. 34° and 43° N. and Long. 130° E.

Additional evidence is furnished as to this sailing course. In the narrated account of the visit of the queen of Sheba to Solomon, she came to Jerusalem with a great train, with camels that bear spices, etc., and when she departed there came no more such abundance of spices as those which the queen of Sheba gave to King Solomon. Have not Persia and Arabia from the earliest times been famous for their fragrant spices? The land of Sheba was undoubtedly located in Arabia or Persia.

The distance from the port of Ezion-geber on the Red sea to the Korean peninsula, as coursed by the steam liners of to-day, is 11,000 miles, and assuming that the seaworthiness and sailing qualities of the ships built by Solomon were little, if any, better than the Chinese junks of the present, they would of necessity follow the coast line, which would increase the distance to 13,000 miles, and allowing two seasons for mining operations, which were made necessary in order to take advantage of the favorable monsoons, and the delays incident to prevailing typhoons, fully three years would be consumed in making a round voyage.

This expedition to the land of Ophir for the purpose of obtaining gold and other material for the House of the Most High was a sacred one, dedicated to the service of the temple,

and the personnel of those detailed to accompany it were selected from among the Levites and from that particular division whose appointed duties were those connected with the treasures of the House of God and treasures of dedicated things, as numbered and minutely specified by David before his death. (I Chr. XXVI.) "For they departed not from the commandment of the king unto the priests and Levites concerning any matter, or concerning the treasures, for so had David, the man of God, commanded." (II Chr. VIII, 14-15). Shehuel, "the son of Gershom, the son of Moses," was ruler of the treasures, and Ahijah was "over" (custodian of) the treasures of the House of God and over the treasures of dedicated things.

The Levites who were consecrated to the service of the temple were numbered, and their number, man by man, was thirty and eight thousand, divided into four divisions. Four thousand were to praise the Lord with instruments. Six thousand were officers and judges. Twenty and four thousand were to set forward the work of the House of the Lord. Four thousand were porters (guardians) from the sons of Merari and from the sons of Kore. This division was known as the Korhites; they were the guardians of the temple, its treasures and the gates. (I Chr. XXVI.)

Therefore, under a strict observance of the commands of David, "from which they departed not in anything," the personnel of the expedition to Ophir must have consisted of Ahijah in command with a detachment of Korhites and the miners and sailors furnished by Hiram, nor is evidence lacking in support of this.

How many voyages were made from Ezion-geber to Ophir is not known—certainly more than one—for "all King Solomon's drinking vessels were of gold, and all the vessels of the forest of Lebanon were of pure gold; none were of silver; it was nothing accounted of in the days of Solomon." (II Chr. IX.) But the search for gold in those days was no less hazardous than it has ever been, and the expedition to Ophir ultimately came to grief—disaster overtook them.

On a beautiful wooded hill, just outside the walls of the ancient and picturesque city of Ping-yang, situated on the left bank of the Tai-dong river, about 80 miles from its mouth, can be seen, in a fine state of preservation, the tomb of Ahijah (Korean pronunciation Kejab), the reputed founder of the Korean empire.

At the foot of the hill, by the side of the imperial road, stands a monument recording that Ahijah, whose grave is near, founded the Korean dynasty, hearing a date corresponding to a period of time between the tenth and eleventh centuries B. C. (or about the date of the building of Solomon's temple), and warns all that this is holy ground and to take heed in passing so sacred a place.

The monument marking the tomb or grave of Ahijah is in the form of an altar, consisting of a large, heavy slab of close-grained granite, accurately squared and approximating five tons in weight, and is supported upon four finely chiseled pedestals, representing copper treasure chests, showing the rivets by which the heads of the chests were fastened, and also the ring handles by which the chests were carried or slung. These pedestals rest upon a substantial stone foundation of unknown depth.

At the head of the grave or tomb, facing the east, stands, carved in close-grained granite, the figure of Ahijah, clad in the vestments and holding in his hand the symbolic key of his office, and on either side, roughly carved in granite, are the two rams of sacrifice. (Ex. XXIX.)

During an invasion of Korea by the Japanese some 300 years ago, the head of one of the rams was broken off by the invaders, and the attempt made at repairing the damage was not all that could have been desired, but undertakes to show what it once was.*

Ahijah's tomb has always been held in great veneration by the Koreans, and from the most ancient times has received constant care and attention from the priests of the temple near by.

The Korean peninsula is about 600 miles long and has an average width of about 135 miles from east to west, giving an area of approximately 81,000 square miles. It is divided from Russian territory by the Yalu and Amnok rivers, and as a whole, is decidedly a mountainous country, but possesses innumerable valleys and foothills, well watered and under a high state of cultivation. The west coast is fringed with one of the most beautiful archipelagoes known, many of the islands being thickly populated and well cultivated. There are few good harbors and only one or two navigable rivers, and these for only a short distance from their mouths.

The geological formation of Korea is simple; it abounds in mineral wealth, which is undeveloped. The climate is the best and healthiest to be found in the Orient, Europeans being entirely free from climatic maladies that seem to prevail in other parts. The summers are temperate; winters quite cold. Average rainfall about 40 inches, one-half of which falls during the months of July and August, rendering travel during this period very difficult.

The population of Korea is variously estimated

from 12,000,000 to 15,000,000; capital, Seoul, 150,000; second city of importance, Ping-yang, 60,000. The government is practically a despotic monarchy. They have no national religion; spirit worship and Shamanism prevail, though the teachings of Confucius are generally accepted as the rule of morality. The Korean, however, when once converted to Christianity, shows clear comprehension and clings to its teachings with great fidelity.

In Korea bondage is practiced, though the lot of the hondsman is not a harsh one, as he may purchase his freedom. The origin of this system of bondage is unknown and is peculiar to the Koreans; not found elsewhere in the Orient.

The Korean language is entirely different from that of the Chinese or Japanese, and has the distinction of being the only Oriental language possessing an alphabet.

The industries of Korea may be said to be principally agriculture and mining. Wheat, barley, rice, millet, beans, potatoes and all kinds of vegetables are grown. Horses, pigs and fine cattle are raised, a few sheep—these are not, however, for the purpose of food and wool, but expressly for royal sacrifice, a singular custom, not found elsewhere in the Orient.

All the mines belong to the king, but gold mining, both alluvial and quartz, is carried on throughout the peninsula under a tribute system. The Korean is the miner of the Orient; at placer mining he is an expert; in quartz he performs wonders, considering the facilities he has at his command. At water level he has to stop; so that the gold quartz mines of Korea, and they are many, are really undeveloped—merely prospected.

The Koreans are a handsome race, possessing a good physique; average height, about 5 feet 6 inches; fine features, some almost patrician; hair, russet brown to black; eyes, hazel to dark brown; noses, straight, many instances aquiline; mouth, well formed, many with mustache and full beard; complexion, dark olive to light brunette; quick and intelligent, and, when given an opportunity, progress rapidly in the ways of the Occidental.

They have no history; from whence they came or when they emigrated even tradition is silent. Chinese and Japanese history records various invasions of Korea, but furnishes little or no reliable information regarding the country; and it has only been since the treaties of 1883, which opened up the "Hermit Nation," that the world has had an opportunity to study this peculiar and interesting people.

Space will not permit, at the present time, of an extended analysis of this exclusive nation, but it is certain that the Koreans, with their general characteristics of feature, complexion, language, alphabet and peculiar customs, never filtered through the Tartar or Chinese races. There is every reason to believe that they are of Semitic origin; that they are, in fact, descendants of the sons of Kore, from whom the country takes its name.

Mining concessions have recently been granted to Americans who are operating on quite an extensive scale and with the most modern appliances, the returns from which indicate that the ancient Ophir is still a land of gold. Steam and electric railroads are being built. Noble men and women, graduates from some of our best medical colleges, are working in the missionary field with most gratifying results, and it seems safe to predict that, at no distant future, this long lost land of Tarshish will take its place as one of the progressive nations of the Orient.

Geology of Southern Nevada and California.

Bulletin No. 208, United States Geological Survey, now in press, is the "Descriptive Geology of Nevada South of the Fortieth Parallel and Adjacent Portions of California," by J. E. Spurr. The route of investigation lay back and forth across Nevada three times, then passing into California by way of the Pahrump valley, it continued through Death valley, over the Panamint range, across the Mohave desert, and ended at San Bernardino. The trip lasted about five months, and comprised over 2,000 miles of actual travel.

The primary object of the expedition was to make a rough general geologic map of the western United States. In order to accomplish the style of mapping desired with due economy of time and labor, the journey was carefully planned so as to avoid any duplication of routes already traveled by geologists. The area to be investigated was bounded on the north by the geologic maps of the Fortieth Parallel Survey, on the east by the geologic maps of the Wheeler Survey, and on the west chiefly by the Turner reconnaissance map of the Sierra Nevada. On the south there were no boundaries.

Mr. Spurr discusses elaborately and in succession the mountain ranges of east central Nevada, of west central Nevada, of southern Nevada, and the Great Basin ranges of California, north of Mohave desert. He notes in passing the ore deposits of the various sections of Nevada and of California which were traversed, and he occasionally comments on the possible origin of these deposits. The bulletin is accompanied by maps.

*See illustration on page 383.

Mining and Metallurgical Patents.

Patents Issued December 16, 1902.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METHOD OF CONSTRUCTING AND LAYING SUBAQUEOUS TUNNELS.—No. 715,768; H. F. Dunham, New York, N. Y.

The method of laying subaqueous tunnels, consisting in erecting support upon section, laying section, erecting support upon second section, lowering second section means first and second supports, erecting support upon third section, lowering third section means of third support and one or more of contiguous supports, thus continuing until sections are all laid.

CAM.—No. 715,830; V. W. Mason, Jr., New York, N. Y.

A cam composed of body and removable engaging face connected thereto composed of plate having rib at each side and ears provided with perforated plugs, and bolts connecting removable face with body which pass through plugs.

APPARATUS FOR SINKING SHAFTS.—No. 715,834; P. G. Moran, Springfield, Ill.

A shield for apparatus for sinking shafts, consisting of shield-pieces pierced by holes, timbers having holes halved in timbers registering with holes in shield-pieces, bolts fitting in holes in timbers and shield-pieces and connecting them with each other; in combination with timber-work on which shield is slidable and means for forcing shield downward.

EXCAVATING APPARATUS.—No. 715,962; R. Bowker, Kokomo, Ind.

In portable excavating apparatus, combination with rotary means for breaking up earth, means for removing broken earth, means for continuously propelling apparatus at speed proportionate to work of removing earth.

TREATMENT OF ZINC ORES.—No. 715,771; F. Ellershausen and R. W. Western, London, England.

A process for treatment zinc ores and other zinciferous matter containing cadmium, consisting in reacting upon same with hydric ammoniac sulphate, washing with ammonium sulphate and treating liquor with zinc in finely divided condition, for separation of cadmium.

ROCK DRILL.—No. 715,993; F. Coyle, Graniteville, Vt.

Combination with piston, of chuck, means for loosely connecting chuck to piston to permit of rotary movement of one with respect to other, means carried by chuck for fixedly clamping tool in position, gib, and screw for actuating gib and locking chuck to piston.

WORKING ZINC AND SUBSTANCES CONTAINING SILICIC ACID IN ELECTRIC FURNACES.—No. 716,008; A. Dorse-magen, Wesel, Germany.

Method of working zinc-silicate ore consisting in preparing charge of zinc silicate and carbon, subjecting charge to action of electric current sufficient to determine reduction and volatilization of zinc and formation of carbid silicon, suitably condensing products of reduction and volatilization.

METHOD OF TREATING MINERAL OILS OR THE DISTILLATES OR RESIDUALS THEREOF.—No. 716,132; J. S. Stewart-Wallace, Knock, Ireland, and W. B. Cowell, London, England.

A method of treating mineral oils consisting in placing them together with 10% water in vessel separate from but connected with still by means of pipe furnished with valve-controlled conduits communicating with vessel at different levels, heating contents of vessel to temperature 180° to 212° F., supplying to vessel from tanks solutions caustic soda and permanganate potash and alumina sulphate heated to temperature 180° to 212° F., and in proportions 1% caustic soda, .5% permanganate of potash, injecting steam into mixture for agitating and maintaining temperature of same at 180° to 212° F., collecting and condensing desired light oils that may be present in mixture and driven off during heating, allowing mixture settle in order that impurities may separate therefrom, drawing off such impurities from lower portion of vessel, permitting remaining portion of treated mixture to flow from vessel to still by suc-

cessively opening aforesaid cocks, commencing with uppermost one thereof, finally collecting distillates.

ORE-CONCENTRATING TABLE.—No. 716,205; W. G. Dodd, San Francisco, Cal.

A concentrating table provided with means for imparting thereto longitudinal and transverse inclination, working surface of table being provided with number of riffles extending longitudinally from overflow-riffle toward its foot, terminals of riffles successively advancing and terminating upon surface of table in curve line, approximating inverted parabola, smooth or unriffled surface to table onto which material collected by riffle is cleaned and separated by being subjected to action of clear water, means for imparting reciprocating motion to table, devices for giving thereto longitudinal and lateral inclination, and means whereby water is admitted onto table for washing material delivered onto unriffled portion thereof.

HOISTING BUCKET.—No. 716,239; O. Johnson and J. Johnson, Milwaukee, Wis.

In hoisting bucket having two bucket segments connected together by pivot shaft, sleeves surrounding shaft and by means of arms connected to segments, head, links connecting head to segments, plurality of sheaves carried by head, arm on each sleeve, sheave carried by each arm, hoisting line passing about sheaves, locking agent comprising means carried by one of sleeves for coacting with means carried by other sleeve to automatically lock bucket in open position, and releasing member operatively connected to agent for contacting with material to be hoisted to unlock bucket and allow same to move to closed position.

EXCAVATING APPARATUS.—No. 716,246; A. Klatt, Collinsville, Cal.

In excavating apparatus, bucket open at bottom and one side, pivoted arm near top, curved scoop mounted on arm, adapted to close bottom and open side, lifting means secured to scoop for opening same, and closing means, consisting of lever arm whose fulcrum is pivot of pivoted arm, and whose outer extremity is on opposite side of pivot from scoop.

Mining Summary.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

Last summer the United States Geological Survey had five parties in the field—two in the Copper River basin, in south-central Alaska, through which it has been proposed to build a railroad from Valdez on the Yukon river. One party under F. C. Schrader, geologist, D. C. Witherspoon, topographer, mapped the upper Copper River basin and adjacent portions of the Tanana River basin. By this, previous surveys were joined. The second party, under T. C. Gardine, topographer, and W. C. Mendenhall, geologist, mapped the Chistochina gold fields and studied the southern copper belt. Additional knowledge was gained regarding copper north and south of the Wrangell group, and geographic data collected concerning the rugged and little known Wrangell mountains. The third party, under A. H. Brooks, in general charge of the Alaskan work of the Survey, and D. L. Reahurn, topographer, with a party, started from the head of Cook inlet and proceeded in a northerly direction to Tanana river. From this point they crossed to Rampart City, on the Yukon. A fourth party, under A. J. Collier, geologist, studied the coal resources of the Yukon valley in United States territory, adjacent to the river. They also visited placer camps not before investigated. The fifth party, with W. J. Peters, topographer, mapped the southeastern parts of the territory near Juneau.

The mill on the Engineer mine, near Skagway, is partly up and two shifts are sinking the shaft. The hoist is in position.

ARIZONA.

COCHISE COUNTY.

The new machinery for the Benson smelter has been shipped from San Francisco, Cal.

A strike is reported in the Pavo Rico, owned by the Atlas Ex. & M. Co. It is a 2-inch streak that assays 1500 ounces silver and 15% copper.

The main drift in the Modern mine, near Bisbee, is in 165 feet from the shaft. The water is hoisted by a bailing skip.

The Miner says over 200 men are doing assessment within a radius of 10 miles of Bisbee. In many cases old shafts are being sunk deeper instead of new holes started, and in some of them good ore has been found by the increase in depth.

The Miner says at the Gaston & Shihley one shaft is down 40 feet in ore. Owing to the lack of hoisting machinery a new shaft has been started east of the former. It lies between the Easter Sunday and the Copper Glance. Superintendent Wagner, Copper Glance M. Co., has put in a truck and two 125-gallon tanks to handle the water in the two-compartment shaft at 505 feet. Sinking has been resumed. A drift south from this shaft at 500 feet is in 40 feet.

The Miner says last week there were 100 men at work in and around Solomon Springs, the Easter Sunday and the Copper Glance on assessment work.

COCONINO COUNTY.

At Williams the smelter of the Anita Con. Copper Co. is completed.

GILA COUNTY.

The United Globe mine will again hoist water with bailing tanks until a new pump can be gotten.

R. M. Force, president of the Arizona Colorado C. B. & G. M. & M. Co., will go to Denver to attend the annual meeting of his company, on Jan. 6, when a new steam hoist and the sinking of a double-compartment shaft will be considered.

A. C. Slesoth, superintendent of the Lake Superior & Arizona M. Co., on Queen creek, near Globe, says the air compressor, Leyner drills and other machinery have been installed and thirty-five men are working.

After two weeks the Old Dominion C. Co., at Globe, has gained control of the water in its working shaft. The big pump on the tenth level raises 500 gallons a minute beside the smaller pumps and bailing tanks. There is another large pump on the twelfth level, which when it is reached will make the control of the water easy. The smelter has been closed on account of a scarcity of fuel oil.

F. P. Hofschulte is developing claims in the Mazatzals, the ore carrying good values in copper and silver. He has 400 feet of work, and will run a tunnel 150 feet.

GRAHAM COUNTY.

Superintendent Braden is pushing work on the Black Rock M. & M. Co. proper-

ties southwest of Fort Thomas. A shaft will be sunk 200 feet.

MOHAVE COUNTY.

Experiments are being made by W. Heimrod on tailings at the Mineral Park mill at Mineral Park. There are several thousand tons of material which will require a large plant.

B. Hastings, superintendent of the Ramrod mines, near Kingman, will build a mill at the mines.

The Yucca Cyanide M. & M. Co. at Cedar Valley is drifting on the lower level in ore.

PIMA COUNTY.

R. Bradford, superintendent of the Copper Hill mines 23 miles from Tucson in the Catalinas, says the cyanide plant will be ready January 10.

PINAL COUNTY.

It is reported that the Pinal Paraffine Oil Co., boring in the Riverside district, has struck oil at 900 feet.

On the Elder-Neiman gold mine, in the Riverside district, the tunnel run to connect with the 300-foot shaft has been completed and has opened up a body of copper carbonates, which also carries gold.

SANTA CRUZ COUNTY.

A strike of ore is reported by the Nogales M. C. Co., near Nogales, in the shaft of the Buena Vista. The assays give 20% copper with silver and gold. This company also owns the Pena Blanca properties. They have ordered concentrators for both mines and propose to also erect a smelter.

YAVAPAI COUNTY.

G. B. Upton, general manager of the Oro Grande Mines Co. of Wickenburg, has gone East to buy a 40 H. P. hoist, air compressor, diamond drill and other machinery for the Oro Grande.

The Courier reports that the Bunker Hill, west of McCahe, has resumed. The Treadwell M. Co. have bought the Boggs & Hackberry mines, near Mayer, and have erected a gallows frame on the Boggs. Douglas, Lacey & Co. have bonded the Casper property at McCahe. This property is on the Jessie lead.

Manager Felt of the McCahe, near Mayer, says the shaft which was partly destroyed by a fire and cave-in is repaired down to the 500 level.

At the Black mine, between the Chicago mill and D. Grubb's properties, Hassayampa district, near Prescott, the shaft is down 180 feet, showing 4 feet of copper and galena. Grading is being done for a steam hoist.

At Douglas, Lacey & Co.'s Hurricane group, near Prescott, a crosscut is being run from the shaft, at 175 feet, to strike the Hard Luck vein 220 feet below the outcrop.

The Courier says the Prescott assay office will put in a stamp mill and cyanide plant. A blue printing and draughting department is being equipped.

At the Iron Queen mine, near Prescott, the grading and retaining walls are finished and the foundation for the 100 ton stamp mill begun. The shaft is down 180 feet and drifts are being run on the 100-foot level.

Superintendent Kent, at the Oriental mill, is putting through thirty tons of ore daily from the Postmaster mine.

The Midnight mine, near Prescott, owned by St. Charles Bros., shipped a carload of ore to the Val Verde smelter last week.

ARKANSAS.

FOLK COUNTY.

A strike of zinc and lead ore has been made at the Davis mines near Mena. The ore was found at 60 feet and the face runs from 4 to 6 feet.

CALIFORNIA.

ALAMEDA COUNTY.

It is reported the Mercantile Oil Co. is negotiating for the purchase of the Campbell Glass Works property in Berkeley, the intention being to use it for an oil refinery.

AMADOR COUNTY.

At the Hoffman, near Jackson, the tunnel being run to tap the ledge is in 300 feet. It is thought the main gouge has been passed by 20 feet, with the tunnel still in slate formation. It will be continued till the greenstone footwall is reached. The object of the tunnel is to ascertain a suitable point to sink a shaft. The point where the tunnel would cut the lode is south of the south face of the drift at the 1400 level of the Argonaut.

Drifts are being run north and south on the 2300-foot level at the South Eureka mine, near Sutter Creek.

At the Kennedy mine, Jackson, 800,000 feet of lumher has been hauled out of 1,000,000 feet required to complete the work on the new mill. The cement foundations for the new hoist are completed.

At Del Monte mines, near Jackson, the superintendent reports total length on

crosscut run in November, two shifts per day, 71 feet, at cost of \$10.06 per foot; distance upraise driven in November, 20 feet, at \$6.44 per foot. Total length of Del Monte tunnel Dec. 1, 155 feet; 30 feet run in November at \$1.32 per foot. Cost of milling during November, including labor, etc., \$140. The mill has been running one shift since Nov. 9th on ore in the hins and ore from the raise. The Del Monte tunnel is expected to crosscut the ledge in another week.

The Gardella mine at Big Bar, near Jackson, has been taken by the company operating the Easy Bird and other properties. D. Black is hauling lumber for necessary buildings. A 2-stamp mill has been in operation on the property for some time with good results to the owner, J. Gardella. The vein is from a few inches to 4 feet wide and carries coarse gold. The county rock is hornblende schist. A dike accompanies the vein. The mine has been worked by tunnels. A winze sunk in the lower tunnel shows 2 feet of ore.

Repairing the shaft at the Zella mine at Jackson is in progress, retimbering from the 400 level to the surface.

The Herald says the water recently struck in the Brunswick mine at the 1200 level is too much for the pumps. To obtain additional power a pipe line will be laid from the South Yuba reservoir, 4700 feet. The line will continue to the Union Hill, the Empire and the North Star mines. The cost of the line is estimated at \$15,000.

CALAVERAS COUNTY.

Near Glencoe the Fanny Marie mill has resumed. The mines of Glencoe have had less attention than their development justifies. The district produces high-grade ores. The veins are mostly in slate, with dike rocks.

A 20-stamp mill is being put up at the Sultana mine near Angels.

W. A. Hildreth, president of the Oriole mine, near Angels, says the 10-stamp mill will soon be ready to run. They have uncovered a vein at the 240-level which has a 42-foot face.

The Mahala mine, owned by S. Redmond and Casey Bros. of San Andreas, situated above Rich Gulch, is reported showing well. The new tunnel is in 400 feet and work begun opening up the lower tunnel.

The Western Mines Co., which has bought the Foote & Thompson mine, near Rich Gulch, have shipped in three carloads of machinery and material; 2500 feet of cast-iron pipe has arrived at the mine, 100,000 feet of lumher has been bought and a six-drill compressor is on the ground.

One hundred and twenty-five men are employed on the ditch and flumes of the Nelson mines at Calaveritas, the work being the widening of 14 miles of ditch and the laying of 1½ miles of 20-inch pipe.

CONTRA COSTA COUNTY.

The Peacock coal mine, 2 miles east of Clayton, has been leased by M. Thomas, who intends to reopen the mine.

EL DORADO COUNTY.

Operations at the California-Bangor slate quarry, Kelsey, were resumed last week under the new ownership.

Articles of incorporation of the Larkin M. Co. have been filed with the county clerk at Placerville, also by the Pyramid Power Co., principal place of business San Francisco.

The Horseshoe M. Co., of Newtown, put in a 6-inch plunger pump last week.

The Montezuma mine at Nashville is to use oil as fuel. The railroad company will deliver the oil at the depot at El Dorado. A 500-gallon tank wagon will convey the oil to the mine.

KERN COUNTY.

(Special Correspondence).—The 30-stamp mill of the Yellow Aster Co. at Randsburg started on the 15th inst, after an idleness of several months owing to inability to obtain sufficient water by pumping from Goler well, which is 450 feet deep. A system of bucket hoists have replaced the pumps in the well and is working satisfactorily, supplying water for both mills. One hundred and thirty stamps are now running.

Randsburg, Cal., Dec. 23.

The Union Oil Co., of Los Angeles, has completed a reservoir in the Kern river field 250 feet square and 27 feet deep, concrete lined, having a capacity of 20,000 barrels. The Standard is building three reservoirs of equal size in the same field.

It is reported Salt Lake men have bought the Kern Crown Oil Co.'s properties at Midway, and have organized the Utah-Midway Oil Co.

MARIPOSA COUNTY.

At the Bonnett mine at Whitlock the ore is crushed in an arastra, and the tailings are discharged under a series of plates. A shaft house, 40x44 feet, has been built on the Imperial and work in the shaft

begun. An 18-inch vein has been opened up.

MONO COUNTY.

It is reported at Reno that C. D. Lane of Angels, Cal. offered Wedekind & Blackburn \$200,000 for the Golden Gate mine in Antelope valley, which was refused. C. L. Hays on his claim adjoining the Golden Gate has cut a 6-foot vein of pay ore.

NEVADA COUNTY.

Superintendent C. C. Weisenberger is putting up a hoisting works at the Buckeye mine, near Grass Valley.

The directors of the South Idaho M. Co. at Grass Valley are considering the purchasing of machinery. Preparations for putting it in are being made.

Pumping is resumed at the W. Y. O. D. mine at Grass Valley, after a month's idleness due to breaking a shaft. During the hang-up the concrete foundations were found to be out of plumb, and after removing the machinery the concrete was blasted out and replaced with new.

The Pennsylvania Co. expects to have the mine unwatered in another week.

PLACER COUNTY.

G. and L. Pease are preparing to mine under permit by the hydraulic process at Yankee Jims, near Colfax. Their tailings will be impounded in Devil's canyon.

The new 10-stamp mill at Black canyon mine, Westville, was started last week.

It is reported the Rising Sun mine, near Colfax, will be reopened. Electric power will be used.

PLUMAS COUNTY.

At the Ohio and Summit mine, Genesee valley, a tunnel to tap the gravel channel is in 50 feet.

SACRAMENTO COUNTY.

It is reported the mine of the Sacramento & Rescue M. Co., on the ranch of Mrs. Hoke, near Mormon Island, has been yielding \$5 a pan.

SAN BENITO COUNTY.

The Hollister Bee says the Cerro Bonito quicksilver mine near Panoche, which has been idle for twenty-five years, will be reopened by the Cerro Bonito M. Co. They will begin operations with forty men.

SANTA BARBARA COUNTY.

The Pinal Oil Co. is pumping oil and drilling has begun for well No. 2. The Brookshire Co., owning adjoining land, will put down a well.

SHASTA COUNTY.

A strike is reported made in the Blue Jay mine in Old Diggings district, near Keswick. The Blue Jay is owned by Sutton & Leaming, who have been doing development work on the property. The ledge, a foot in width, contains copper ore and was tapped at 60 feet by a 100-foot tunnel, and assays show both gold and copper. The property is near the Keswick smelters.

General-Manager L. T. Wright of the Mountain C. Co. has made formal reply to Judge Sweeney, who, representing the merchants committee, interviewed Wright regarding a settlement of the strike. Mr. Wright states that "the company has discharged no man because of his union sympathies or affiliations," and says "the company employs a large number of men belonging to unions other than the Western Federation of Miners whose official recognition is now demanded. In fact, when this strike was ordered these branches did not number 25% of all the company's employees, and that it also gives employment to a number of men who do not belong to any union. To recognize these branches of the Western Federation of Miners would be to put the whole body of employees at the dictation of a small faction. This demand being inadmissible, the company will never consent to it. I have therefore to inform you that the company cannot accede to the committee and that its decision as stated in this letter must be considered as final."

TUOLUMNE COUNTY.

S. W. Blakely has bonded the John Royal mine, 2½ miles northeast of Columbia, for \$6500, before Oct. 1, 1903, \$1625 cash. He agrees to sink 112 feet deeper on the vein.

Breasting gravel has begun in the Woodside drift mine on Table mountain, west of Columbia. The first day a miner picking gravel found a \$55 nugget, and several others were picked out of the gravel.

The Lost Fox mine, southeast of Carters, is running and the twenty stamps are dropping.

The Providence mine, near Carters, is down 1000 feet and the 10-stamp mill is running.

The Grizzly mine, south of Carters, is drifting on the 1000 level.

C. W. Quilty of San Jose, Cal., has deeded to B. W. Hersey the Sugar Loaf gravel mine on Corcoran flat; also Blue Lead placer claims.

T. W. Webb of Jacksonville has deeded

to C. Strathmore of San Francisco, Cal., a half interest in a water right on the Tuolumne river, to be diverted 2 miles east of Jacksonville; also the San Jose placer claim. Mr. Wehh retains a half interest.

The Punter mine at Campbell's Flat, near Seneca, is being unwatered to permit examination. The hoist on the Free Lance mine is completed and sinking resumed, with twenty men on the payroll.

It is reported that W. A. Neville, owner of the Rawlids mine, near Jamestown, with others, will build a railroad from Stockton to the mining region of Tuolumne county.

The Golden Gate M. Co., near Sonora, is using oil for fuel in its chlorination plant.

Superintendent M. C. Dale, at the Shoenberg, near Groveland, has the tunnel in 312 feet. Three shafts have been sunk on the vein, the deepest 85 feet, where the water came in too fast to be handled without pumps.

The Mayflower tunnel, near Groveland, is in 300 feet and driving ahead 9 feet per day with machine drills. It is the intention to run 200 feet farther before raising the gravel.

TRINITY COUNTY.

It is reported that the Shurtleff mine, near Weaverville, has been bought by the Sweep-takes Co. The Shurtleff mine is from 15 to 200 feet wide for 1000 feet. The ore assays \$6. It also carries copper.

The Journal says most of the mines on Coffee creek have shut down for the winter, with the exception of the Dorleska, on Union creek. The Three Peaks M. Co., on Battle Creek, near the Nash mine, 6 miles northeast from Dorleska, are getting in supplies and machinery.

The Nash gravel mine will run during the winter months.

On Deacon creek, M. Rose, of Redding, is hydraulicking.

The Golden Jubilee and Wagner mines, on lower Coffee creek, are shut down for the winter. It is said tunnel contracts will be let on the former.

The Streda mine near Carrville, has closed down for the winter, but the Headlight, on the same side of the river, continues.

Near Trinity Center, the Sykes gravel mine is working full handed; Superintendent E. Ellery.

The hoist at the Enterprise mine, near Weaverville, is in operation and the lower tunnel is in 900 feet, with 400 feet farther to run.

A contract has been let for driving 300 feet on the Jenny Lind and Maple tunnel, northwest of Coleridge. It is in 100 feet and will crosscut the lead 400 feet below the apex. These claims adjoin the Chloride-Balley. E. Ehrenberg is superintendent.

At the Headlight mine, near Carrville, Superintendent Fletcher says the 100-foot raise from the lower tunnel to the surface has been completed. A contract has been let for breaking daily seventy-five tons of ore. Three ore bins have been built with a capacity of 500 tons.

COLORADO.

BOULDER COUNTY.

At the Ben C. Lowell mine at Magnolia W. H. Hirschfeld reports ore on the 200 level showing free gold and telluride. Levels are being driven east and west with steam drills. At the 250-foot level the same ore is found. At the 325-foot level contractors have uncovered the same shoot.

F. Leonard, superintendent of the Cash mine, is working twenty-eight men. Some of the ore is sylvanite. A two-car shipment was made last week.

The Ward H. Lamon tunnel is in 500 feet. It will take 200 feet more to reach the vein.

The Cumberland tunnel, which is being driven under the India shaft, is in 1000 feet and in ore.

The surface strike of ore in the Livingston mine is being prospected by a drift northwest along the dike toward the Sphinx lode, an extension of the Livingston. Consolidation of the properties has been effected and G. Teal is manager of the new company. The company intends to sink a shaft. On the south end of the Livingston, in the Anchor group, a similar ore shoot has been opened, which will be developed by Topeka, Kan., men.

A strike in the Eldora, near Eldora, is reported in a winze sunk in the 125-foot level. A 20-inch vein has been found, assaying \$118 in gold. An inch and a half pay streak is rich.

The Wano at Jamestown, owned by an Eastern syndicate, has made a strike of low-grade ore. A. Brown, manager, says the vein is 30 feet wide. They will build a mill.

CHAFFEE COUNTY.

The Salida smelter is taking 200 tons daily from the New Monarch, 40 tons of iron from the Catalpa-Crescent, and a

large quantity of low-grade silver ore from the Dinero dump, Lake county.

The Columbus M. Co., owners of the Columbus mine in the Monarch district, near Salida, is again to be operated by its owners after being under lease and bond to the Sedalla Co. for two years. R. Good is superintendent. A tunnel is to be driven, the tram rebuilt and a concentrator put up.—Chinn & Roller have suspended operations on the Darling mine on account of snow.—G. Crosby, operating the Lilly, is shipping forty to fifty tons weekly.—The McDonald mine, owned by Eller & Co. of Pueblo, is shipping four cars per week. Fifteen men are at work. The Eclipse is shipping five cars weekly.—C. H. Moore, one of the owners of the Masen, says operations will be resumed. It is proposed to begin work at the Wilson mine and a 500-foot contract has been let.

CLEAR CREEK COUNTY.

A 200-ton concentrating mill and a 500 H. P. electric light and power plant are projected on a 200-acre tract on Snake creek, near Argentine, 12 miles from Georgetown, says Clear Creek Topics, by Pennsylvania and New York men, to treat ores of the Rothschild M. Co.

The Silver Glance mine has made a strike. This mine is 2 miles from Georgetown. After a long idleness J. H. Burkholder, O. Winn, G. Berg, O. Berg and Dr. Cline of Georgetown took a lease and bond on the property of eight claims. For two and a half years they drove the Queen tunnel on a level with the bottom of the shaft, which had been sunk 500 feet. After driving 1200 feet a crosscut was run toward the old shaft. While they were at supper the miners heard a noise like that of a cannon and a stream of water, 4 feet wide and 6 feet high, came from the tunnel, carrying everything with it. This lasted twenty minutes and the mine was drained. The vein was found and raises started, and four levels are being driven in one of the richest veins opened in camp within ten years. On the sixth level, east, is a streak of glance 20 inches wide, with 3 feet of good grade quartz. The same ore is found in two levels above. The machinery at the shaft, near the top of the mountain, will be moved and a shaft sunk on the vein from the seventh level. The crosscut from the Kelly tunnel will cut this vein at great depth.

Eight inches of peacock ore has been found in the Nashville in Russell gulch, near Idaho Springs. The vein is 6 feet wide of milling ore. The property is equipped with a whim and sinking will be continued. The claim is worked by Moscript, Ford, Huillet & Oliver. They also work an adjoining claim. A hoist will be placed on one or both of the properties.

The Old Stag G. M. Co., near Idaho Springs, is installing a plant for developing the Old Stag. The plant consists of a 12x14x16 steam driven Rand air compressor and a 60 H. P. boiler. The tunnel is in 200 feet; 500 feet more will reach the vein, 500 feet deeper than the Lamartine tunnel. H. H. Parmeter, superintendent.

CUSTER COUNTY.

In the Gold Wonder, $\frac{1}{2}$ mile east of Silver Cliff, a strike is reported of a low-grade ore body. C. Haskell and associates, the owners, will put in machinery and a mill.

Work is to begin on the Elematah lode, near the Bassick. It is owned by the Aburdix G. M. Co., of which G. W. Avery is superintendent.

The Bassick mine is working three shifts in the 1250 level; it is said the richest ore found is on the 1500 and 1600 levels. The ore is sorted and the high grade shipped to smelters and the low grade concentrated at the mill, the capacity of which is to be increased to 300 tons.

It is reported that the American Flag is to resume.

The Powhattan tunnel works two shifts. It is in 850 feet, and with an additional 100 feet the ore body previously opened in a winze in the Powhattan will be cut at 300 feet from the surface.

Ashland & Johnson, driving a tunnel on the Ethel vein, have found quartz, some of which is high grade.

Little & Hawker, working the South Humboldt, have made a shipment which returned gold, silver and lead \$64 to the ton.

The Toledo mine, near Silver Cliff, is to start up, the machinery being installed. The new buildings are completed; Superintendent G. Raymond.

At the Bull Domingo twelve men are working, one shift in the 550 and the other in the 1000 level.

DOLORES COUNTY.

McGill & Laube made a carload shipment of ore from their lease on a block of Newman ground near Rico last week.

Superintendent Nathan is arranging to install thirty more stamps in the Emma mill, at Dunton. While working in the fifth level stope last week, 1000 feet back

from the breast of the main tunnel, a minor broke into a pocket of wire silver. This ore will be shipped.

GILPIN COUNTY.

E. R. Fouts, D. Davies and G. Millor have organized the Grizzly M. M. & L. Co. and will operate the Grizzly lode at Russell gulch.

The Miners' Ore Sampling Works at Black Hawk is reported closed down, owing to lack of a market for the ores they purchased.

At the East Netaway mine Superintendent Draper says they have opened ore on the 180-foot level and that in the 120 level, east of the Mitchell shaft, they have ore carrying free gold. The south vein has been struck at a depth of 555 feet showing 1 foot of ore, but the pay shoot is to the east. Work is being carried on in the 200 and 250-foot levels of the Vivian and they both are in ore. The property is operated by the Town Topics G. M. Co.

During November the shipments from the Quartz hill properties of the Kansas-Burroughs Con. M. Co. were 214 cars. Most of the product was milling ore.

The Independent sampler at Black Hawk has suspended operations. It was run in connection with metallurgical works owned by the same company at Deadwood, S. D.

GUNNISON COUNTY.

The Post says the interest in the Brunswick M. & M. Co., owned by the Halsey heirs, has been sold to A. Lejune. The company owns the Mack mine, near Tin Cup, also a 100-ton concentrating plant. The operators are driving a tunnel into West Gold hill to cut the Mack vein at depth. There is in the upper workings milling ore besides shipping material. The mill will be partially remodeled. The Commercial group is being operated by its owners. The shaft, now 150 feet deep, will be sunk 100 feet farther, and a level run at that point. In the 150-foot level a foot of ore is showing which averages \$50.

The West Gold Hill M. Co. recently found a vein of ore in its tunnel hut the main vein has not been cut yet.

Hamlin & Reed have opened a 4-foot vein in a 70-foot shaft on the Nancy Hanks on West mountain in the Quartz Creek district.

The Ashland M. Co. has cut a vein of ore in the Carter tunnel at 1381 feet, assaying \$16.

The Post says the Akron M. Co. is making good headway driving into Lake hill at Whitepine. They expect to cut the North Star ore bodies early in the spring.

A. J. Underwood, operating the Bill Short near Whitepine, is shipping ore and expects to increase his output. A hoisting plant has been installed on the David H. The Eureka and Erie properties, operated by D. C. Tobin, are shipping eight to ten tons per day.

On the Nancy Hanks on West mountain, near Gunnison, Hamlin & Reed have run a drift from the bottom of their 70-foot shaft opening up a 4-foot vein. G. W. Duncan will sink the Commercial shaft on Gold hill 100 feet deeper, giving a vertical depth of 250 feet.

The Eureka and Nest Egg mines, at White Pine, are shipping eight to ten tons per day. The values are in silver and lead. The past summer twenty tons were daily treated by the Tomichi concentrator. The Bill Short, in the district, is shipping to the Salida smelter. A new hoisting plant has been installed at the David H. The Akron M. Co. is pushing the new tunnel. It is in 2000 feet and will soon cut the North Star ore bodies.

The Revenue group, in Box Canyon district, south of Ohio City, was recently bought by New York parties. A vein 6 feet wide is opened, assaying \$50 gold. A new road will be built and the necessary buildings and machinery will be placed.

LAKE COUNTY.

The New Valentine M. Co., near Leadville, has resumed operations and the two sinking pumps with a capacity of 800 gallons each are raising the water from the shaft.

Twin Lakes has a strike on Bull hill, on the Last Chance, in a vein 30 feet wide, carrying copper and gold. The company has started a tunnel to cut the vein. The Last Chance Co. owners propose to build a cyanide plant if the vein shows up well.

The Fryer Hill M. Co., which is handling water through its El Paso shaft, is getting its shafts and workings in shape and increasing its tonnage. In addition to the low-grade ore bodies in the old workings the company will carry on work in virgin territory. In the Tip Top and Bangkok-Cora Belle some good ore is being developed in new ground.

The strike made in the Cooper shaft at Leadville is supposed to be the continuation of the Fryer Hill ore shoot.

MINERAL COUNTY.

The Humphreys mill at Creede has

shut down to give the machinery an overhauling. All the ore about the mill and bins was cleaned up. The mines will continue work, but the ore will be shipped, the milling ore left standing until the mill resumes. Improvements are being made in the mill. A Chilli mill for fine grinding of the zinc has been installed and an elevator is being put in. The company have contracted for a steam power plant.

Last week the tenth north level of the Happy Thought cut the ore shoot, which is the farthest north the vein has been explored at that depth.

PARK COUNTY.

At Alma there is sufficient snow to retard mining and shipments, though many mines are working in a small way.

The London mine is shipping high-grade ore. The ore is hauled on sleds from the mine half way to the Colorado & Southern sidings, and transferred to wagons. The London is driving 1000 feet of new tunnel from the South Mosquito side of the mountain.

In Horseshoe district the Hill Top mine has resumed and will ship to smelters and operate its mill. The Last Chance mill is to treat ores from the Chance, Peerless and Peerless Maud mines.

Chicago men, incorporated as the Illinois-Colorado Oil, Gas & Coal Co., have built a plant, with derrick, power and other equipment for sinking 3000 feet in the South Park oil field near Alma. One thousand acres of land in this field have been bought by the People's Union Oil Co. of California, which will sink a well.

It is reported that connection has been made at the Hock Hocking mine between the tunnel upraise and the upper workings, draining those levels. With the draining of these levels the management expects soon to resume shipments of ore.

At the Arnette mine, being developed under lease and bond by A. D. Hunt of Leadville, is reported in the drift being run on the 50-foot level, a 15-inch streak of ore from which assays as high as seven ounces gold have been had. This is on the lime and porphyry contact. At a depth of 96 feet 3 feet of vein matter appears in the granite.

RIO GRANDE COUNTY.

Seventy-two thousand pounds of machinery, including cyanide tanks, are to be placed in the Annie mill by February 15th. P. Schuch, Jr., superintendent. In the event of success a new mill with a capacity of 100 tons per day will be put in.

SAN JUAN COUNTY.

The Old Times group on Bear mountain, near Silverton, made a 6-ton shipment last week, says the Miner. Smelter tests and other tests from a streak of ore 18 inches wide ran \$30. The latest test showed \$320 gold, \$13.10 silver and 20% lead. The vein is cut at the end of a 135-foot tunnel driven on the Old Times vein. It is the intention to drive all winter on development, and within 100 feet farther a vein 9 feet wide on the surface will be cut in the tunnel at a depth of 200 feet. This group lies near the Fitzhugh Lee group, which are being developed by the Woods Investment Co. of Colorado Springs.

J. T. Manners has bought the Edith claim on Tower mountain, near Silverton. The claim is on the same lead as the Dakota and Rowdy Boy. The Mogul mine is working forty men. The tunnel is in 2500 feet. Another 100 feet on the Ore tunnel was contracted for last week. One of the veins, thought to be the Manhattan, was cut last week by the Netaway Co. in the Thunder tunnel. The Alethea is the vein for which the tunnel is being run. The Tamarack M. Co. is the new incorporation of the Big Five Co. The properties are located on Tower mountain and a tunnel is proposed running from a point near Howardsville. Mr. Abbott is developing the Golden Wedge on South Lookout mountain. The vein is 10 feet wide and carries gold, silver and lead. Mr. Abbott owns 4500 feet on the vein.

The Smuggler-Union M. Co. at Telluride has resumed; 100 men were sent to the mine last week. The men were all Americans and Cornishmen. For a week men have been cleaning up the mine and the mill is in shape for work.

The Hurley tunnel at Silverton is advancing 7 feet per day and in 1700 feet. Machine drills are to be put in.

A 15-inch streak of gray copper ore in the upraise on the Lookout vein at Silverton has opened to a 4-foot body.

SUMMIT COUNTY.

The Cashier, Pride and small properties in the districts tributary to Breckenridge are employing 300 men. Shipments are regular and the sampler is busy.

Superintendent A. Boyd, the Fanchon M. Co., in Sugar Loaf district, is shipping ore. Returns have been received for one lot of fifty tons which netted \$1155. Two more lots are on the road. The shaft is

down 225 feet, with one drift on vein 175 feet and another 150 feet. The R. A. M. is shipping 100 tons per day of zinc ore. This comes from a body of ore previously developed. The intention is to increase the output.

The Breckenridge sampler handled over 1000 tons of ore and concentrates during November. The bulk of it came from the Mountain Pride at Breckenridge, the Nettie B. at Kokomo, the Pennsylvania at Argentine, the Pride and California at Montezuma.

In the Salt Lick placer, 1 mile north of Dillon, while doing assessment work, \$1300 worth of coarse and fine placer gold was taken out recently.

J. B. Conrad of Breckenridge, who has been developing the Ettigridge group on Little Mountain, has made shipments running from 300 to 400 ounces silver and from \$150 to \$250 gold, found a mass of native silver weighing three pounds on his claim.

The new machinery at the Cashier mine in Brown's gulch will treble the output. Fifty tons per day are being crushed by the 20-stamp mill.

Work has been resumed by the Puzzle Extension Co. Manager Achter says the upraise has 60 feet to go before connecting with the tunnel.

W. Condon and others are working the Pacific in Dry gulch, which produces lead and an oxidized gold ore.

Risley & Horn last week shipped twenty tons of lead ore that carries gold and silver from their property above timber line on Mount Baldy, near Breckenridge.

TELLER COUNTY.

The Doctor ore shoot is reported to have been cut by lessees in the bottom level of the Doctor-Jack Pot. Cripple Creek district. The Jack Pot M. Co. has granted a lease on the south end of the Iron Master lode of that company to S. Vidler of Cripple Creek for eighteen months and calls for 100 shifts of work each month. Vidler is operating on the adjoining 300-foot block to the north of this property.

The El Paso Co. have taken up their option on the Morning Star property, which consists of the Morning Star on Beacon hill and the Roy Fleming on Bull hill, near Cripple Creek. The Morning Star Co. is to dissolve and will pay its stockholders a final dividend of 5 cents a share, says the Times.

C. J. Garvin, recently superintendent of the Portland G. M. Co., Cripple Creek, has a two years' lease on the property of the Pappose G. M. Co.

The treasurer's report to the shareholders of the Cripple Creek Con. M. Co., Cripple Creek district, for the past year shows an income from royalties of \$3057.68.

The Chicago men working the Addie C on Mineral hill, Cripple Creek district, are obtaining assays on seams of ore in the crosscuts at the 430 level that run \$1000, says Superintendent Walsb.

In Cripple Creek district Hickman & Gilbert are sinking a shaft on the north end of the Sheriff claim and are down 30 feet in pay ore. The ground is west of the War Eagle. The Milwaukee syndicate, operating the Le Clair fraction on Raven hill, has its new machinery up and hoisting water from the shaft. A contract was let this week to sink. Horn, Archibald & Co., lessees on the 200 level of the E. Porter Gold King, have settled for their last shipment on a basis of \$52 a ton.

A strike has been made on the Ida May on Raven hill, Cripple Creek district. The junction of two veins has been found showing 4 feet of ore. The Little Frank S on Raven hill is shipping ore. At a depth of 320 feet the south extension of the Joe Dandy vein was entered last week. This vein is 4 feet wide and assays \$20. Shipments have begun.

All rock hoisted from the War Eagle, Cripple Creek, is shipped without sorting, an unusual thing, even for Cripple Creek.

The C. K. & N. Co. at Cripple Creek have paid a dividend of \$14,319. The property is located on the west slope of Beacon hill and is producing thirty tons of ore daily. Lessee Granfield is operating the property.

At 160 feet in the new shaft on the south end of the Golconda at Victor an ore body has been opened up. The vein is 4 feet wide and carries two ounces in gold to the ton.

Miners are employed on the Londonderry, Cripple Creek district, in proving the apex of the vein in controversy between the Wild Horse, owned by the United Mines Co., and the Londonderry. A jury is secured in the district court for the third apex suit of the Sunshine vs. the Sedan. The La Montagne M. & L. Co., operating on Block 8 of school section 16, is shipping medium-grade ore. At the 450-foot level a drift has been run 60 feet on the vein. It carries 2 feet of pay rock.

D. Weyand, president of the Jennie Sample Con. Co., Cripple Creek district,

says lessee Babbitt, operating on the main workings of the company, shipped last week a car of five-ounce ore from the 400 level. On the third level he is getting out coarse rock, a car of which ran 1.75 ounce per ton.

H. C. Doil, superintendent of the Ophir, is working a lease on the Minnebaha claim. He has run a tunnel on a vein and opened what appears to be the extension of the Gold Dollar under the wash. The vein is 6 feet wide.

Read, Morgan & Whetstone, lessees on the Morning Glory claims of the Work Co., have made a shipment of screenings which returned one ounce to the ton. This came from Block F where they opened the extension of the Jack Pot vein upon the line between the two properties.

It is reported that miners sinking the shaft on the west slope of Cow mountain, near Cripple Creek, have found a 2-foot vein which assays \$12 to \$20.

Lessee Granfield, on the C. K. & N., is shipping thirty tons per day.

The El Paso Con. mines on Beacon hill, Cripple Creek, are outputting thirty to thirty-five tons per day of the richest ore shipped in quantity from any mine in the Cripple Creek district. The mine has been troubled with water. It is being controlled. No attempt will be made at present to get below the 400 level.

The shaft house of the Bolivia of the Dorcas G. M. Co., near Gillett, was destroyed last week by fire. Loss to machinery is \$6000.

B. Ross and W. O. Temple are reported to have leased the Midland sampler at the head of Poverty gulch, Cripple Creek district, and will put in a large cyanide plant as soon as tanks can be secured.

A suit involving valuable claims at Victor has been filed in the United States Circuit Court. P. Brown of Lake Mills, Iowa, plaintiff, sues as a stockholder of the Mount Rosa M. Co., alleging mismanagement. The Woods Investment Co. of Colorado Springs is principal defendant.

IDAHO.

ADA COUNTY.

M. M. Gibson has organized a company to develop the Grant and Globe claims, 5 miles from Boise. A tunnel will cut the ledges in the Globe at 400 feet, and another will be 200 feet deep on the Grant No. 1. One of the ledges of the Globe is 14 feet ore. A concentrating plant will be built with a daily capacity of fifty tons. The company is the Idaho-Globe M. Co.

BANNOCK COUNTY.

A smelter is proposed at Pocatello by the Great Western M. & M. Co., which owns a group of seventeen claims known as the Hovey claims, 6 miles east of Pocatello, and near Mosquito Springs. A tunnel being driven is in 180 feet, tapping a body of ore 8 feet wide into which they have drifted 30 feet. The ore, it is said, will average 15% copper.

The Pocatello G. & C. M. Co., Ltd., is incorporated at Pocatello; G. H. Olmstead. The property is a group of copper claims on Pocatello creek, 8 miles east of Pocatello. The nucleus of the group is the Moonlight, which exposes a 2-foot vein of copper sulphides.

BLAINE COUNTY.

It is reported that operations will be resumed at the Red Cloud mines, near Hailey, with twenty men.

BOISE COUNTY.

The Ingle M. Co. is taking ore from the Golden Star at Centerville. Mr. Ingle has opened up a second vein not found by the former owners.

The men holding a bond on the Summit, near Idaho City, are repairing the mill.

A shaft is being sunk on the Ebenezer, near Quartzburg; ten men employed. W. D. Southworth has a bond on the property, also on Knight & Co.'s Mountain Chief, adjoining.

CLAYTON COUNTY.

The Valley Creek mill in Stanley basin is completed, but the cyanide plant is not yet ready. Four men will spend the winter driving a tunnel. The last loads of supplies for Stanley basin could not get through via Galena on account of snow, teamsters returning to Ketchum, whence they shipped by rail to Mackay.

ELMORE COUNTY.

The Lawrence Con. M. Co. has incorporated to operate the Jingo group of sixteen lode and two placer mines in the northern part of the county.

IDAHO COUNTY.

J. A. McEachern of the Buffalo Star M. Co. in Buffalo Hump district, says the tunnel has been driven 300 feet and a 500-foot shaft will be sunk in the spring. The ore cut is 30 feet wide, assaying \$10. The company put in a 10-stamp mill.

T. Parks and J. McKay, from Buffalo Hump, report 6 feet of snow in the Hump. The Big Buffalo is keeping up shipments

of \$10,000 bullion monthly and other mills in the camp are working steadily. They confirm the report of a strike in the Liberty Bell.

A find of placer gold and platinum is reported from Cottonwood of several acres in extent in a gravel deposit.

MINERAL COUNTY.

The Big Kanawha at Creede will not be compelled to shut down owing to drop in silver, as their product is principally gold and development work will continue. Creede ores contain a high per cent in silica, which is not usual with the shipping ores of the West. Properties affected by lower silver are the Commodore, Del Monte, New York, Bachelor, Corsair and Alpha. The Monte Carlo, Mollie S. and Punxsutawney produce chloride ore; the Big Kanawha gold, lead and zinc; the Solomon, Ethel, Moses and Ridge produce a lead and zinc ore. The leasers on the Ridge have struck a new ore shoot. The ore is a clean galena.

NEZ PERCE COUNTY.

A new gold-copper strike is reported, 7 miles northeast of Nez Perce and 3 miles from Pardee, and a large number of claims have been taken. The discovery was made by L. Ellis and G. Murray, who two weeks ago began to sink and at a depth of 20 feet cut through 3½ feet of copper glance.

SHOSHONE COUNTY.

In the lower tunnel of the Snowstorm copper mine large nuggets of galena and chalcophyrite have been found.

MICHIGAN.

HOUGHTON COUNTY.

It is reported that the Michigan C. M. Co., near Houghton, will build a one-head stamp mill in the spring, President Stanton having recently reached this decision.

The Butler tunnel of the Adventure mine, near Houghton, has cut the Evergreen lode, in 800 feet, the lode being the most southerly of the seven veins which cross the property. This tunnel cuts the lode 150 feet below the outcrop. The lode is also cut by the crosscut from No. 2 shaft, 250 feet below the outcrop. Two beads are running in the mill stamping 950 tons daily. A third head is to be started soon.

Reports from Houghton say the latest estimates of Lake production of copper are between 170,000,000 and 180,000,000 pounds of refined copper for the year 1902.

MONTANA.

CARBON COUNTY.

In Carbon county strata oil has been discovered by T. Cruise, of Helena, who says he has sunk four wells on Butcher creek, the greatest depth being 1400 feet. At 400 feet oil-bearing sands were encountered. A conglomerate of white sand and quartz pebbles was pierced, and found to be 40 feet in thickness. Another well at 400 feet into this same stratum brought a flow of oil which interfered with further sinking, and another well has been started.

FERGUS COUNTY.

The South Kendall group, comprising the Blue Jay, Silver Bow and Nipper claims, near Lewiston, are reported sold to H. S. Corbett of Spokane, Wash. Development work has been done on the claims.

FLATHEAD COUNTY.

In the Snowshoe and Fisher districts, operations are closed for the winter, owing to snow, which is 8 feet deep.

The Banner & Bangle mine, near Troy, is reported sold to P. Larson, T. Greenough and L. P. Larson for \$50,000. Superintendent L. P. Larson says it is a lead-zinc proposition and developed by tunnels on five levels. The lode is between quartzite and metamorphosed slate and is 4 to 10 feet wide. The lead and zinc are in separate shoots, the lead being in the form of galena.

The first payment is reported made on 1000 acres of placer ground on upper Libby creek by the Libby Placer Co.

GRANITE COUNTY.

The Call reports the Butte & Garnet M. Co. incorporated by J. Farrell, H. T. and D. Lewis, J. O'Rourke et al., to work the Grant & Hartford property at Garnet.

JEFFERSON COUNTY.

H. Freyler, manager of the New Boston Co. property, in the Corbin district, says he has struck a vein of copper and silver ore in the shaft of the Badger claim of the group owned by his company at a depth of 65 feet. He says 2 feet of the ore samples 12% copper and thirty ounces in silver. The shaft of the Bertha mine, which adjoins the Badger, is down 190 feet. In the Flambeau, adjoining the Badger on the west, 2 feet of ore is reported at a depth of 120 feet.

SILVER BOW COUNTY.

By a decision of the supreme court the Boston & Montana C. & S. M. Co. is given

complete ownership of the one-fourth interest in the Comanche mine at Butte, claimed by A. Wetzelstein. The lower court declared the company to hold a legal title in the property.

SWEETGRASS COUNTY.

A syndicate of Montana men propose to exploit the oil tracts in Sweetgrass county where oil has been known for some time, the oil-bearing strata of Carbon county, which borders Sweetgrass on the east, extending into it.

NEVADA.

LANDER COUNTY.

T. K. Coe, assistant superintendent of the Dead M. Co. at Dean, reports a strike in the tunnel connecting the Dean with the property bought from the Pittsburg & London Con. M. Co. on the opposite side of the hill. A lower tunnel is being run to tap the vein 500 feet deeper.

LINCOLN COUNTY.

The Silver King M. Co. of Nevada is incorporated to operate the J. B. McGee group of mines at Silver King, 35 miles west of Ploche.

The Good Hope mine at Searchlight is putting in a gas hoist. The prospect is being developed and a mill is to be considered later. Dr. Carber of Los Angeles, Cal., is principal owner.

There are three mines with mills in operation in Searchlight, employing 100 men.

Superintendent A. J. Rees of the Thistle M. & M. Co. of DeLamar reports a strike of 3 feet of ore similar to that in the Magnolia, near by. The ore was struck in a drift on the 100 level at 160 feet, and in running the drift they cut several small veins of iron and silver. From the 100-foot level they will sink the shaft another 100 feet.

STOREY COUNTY.

Rails, lumber and supplies have been delivered at the mouth of the Daney tunnel, where the Silver City M. & D. Co. has commenced the work of draining the Devil Gate and Chinatown districts. The tunnel is already in 800 feet and will be extended to the Kossuth shaft 9000 feet, which it will strike at a depth of 450 feet, where ore is known to exist. The company will follow the Daney vein through Spring Valley and extract ore. Electric wires are being strung for power and a mill will be built. It is the intention to extend to American Flat. J. H. Kinkead is superintendent.

NEW MEXICO.

COLFAX COUNTY.

A. C. Majors, secretary the New Mexico Oil & Gas Co., says he will begin drilling on the McKown ranch, near Raton, next week.

OREGON.

BAKER COUNTY.

An addition is being built to the mill at the Phoenix, near Sumpter. At the Hidden Treasure a hoist is being put in and other additions. The Forest M. Co. has been organized by the Advance M. Co., T. J. Costello, J. Collins, J. H. Pruitt, E. L. Manning, to develop the Storm King group in the Cable Cove district. There are seven claims in the group.

President L. C. Jacquish of the American D. & M. Co., owner of the Blue Canyon placers near Auburn, says they have Littlefield's water rights and placer grounds, on a three-year lease with option to purchase.

The Tempest Co., near Sumpter, is building a sawmill and intend to put in a water jacket furnace. They have finished 4 miles of road to join the Red Lion road from the Badger.

Near Sumpter the Morning group, owned by Simmons, Ames & Cooper, will put in a mill. The property has a large vein, between slate and a dike, the ore being 7 feet wide.

The Morning Glory mine, near Sumpter, is to put in machinery.

A vein of nickel ore is reported uncovered in the Panhandle district. The claim is in the copper belt, 10 miles from Ballard's Landing. J. J. Howard and R. McKimm are the owners. They have begun work on the Manila group of copper claims in the same belt.

GRANT COUNTY.

The machinery for the stamp mill to be erected at the Virginia in the Greenhorn district is on the ground. An air compressor is being put in at the Bluebird in the Granite district.

The Cougar mine will resume; thirty men are at work and more will be added. The roasting plant is finished.

JACKSON COUNTY.

J. W. Opp has started his quartz mill on the Golden Standard mine near Jacksonville.

JOSEPHINE COUNTY.

The Homestake property in Evans Creek district, 9 miles from Grant's Pass,

is reported bonded to Eastern men for \$8000.

KLAMATH COUNTY.

The mill at the Mattern mine is making a run, wood being obtained to supply furnaces for a time. There will be no continuous operation until spring, when electric power can be had. Power is to be supplied by the electric plant being constructed on Falls creek, above Klamath, 12 miles from the Mattern. It is expected to be ready by April 1.

The Jilison mine has its force increased. The ledge has widened. The mill is to be started.

The 500 level has been reached in the coal mine near Ager.

A third shoot of ore has been found in the Belcher, near Bonanza, says Superintendent P. A. Brady. The grade of ore is better than before. The face of the drift is 300 feet from the surface. Mr. Brady said it is the intention to build a mill, the building and frame being for twenty stamps, but ten would be put in at first.

At Bonanza the Gold Boy mine is reported sold to Eastern men. It is the east extension of the Bonanza. Development consists of two crosscut tunnels, 925 and 425 feet, respectively, driven to cut the three veins. A shaft on the extension of the Bonanza vein has a depth of 60 feet. It is intended to use the Empire mill, near by. J. H. Bolland is in charge.

While drifting on the 175 level of the Dixie Meadows mine, near Prairie City, a 7-foot vein was opened up, 3 feet of which is shipping ore. Three shifts are working in the lower tunnel, which is in 300 feet, and expect to reach the vein on the 300-foot level by February 15. An assay office has been added the past week.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Deadwood people owning the Potsdam group of mines at Cyanide are opening up a body of milling ore and propose to build a reduction plant in the spring.

The Hidden Fortune plant in the first ward, Deadwood, is about completed. The pump is being set up.

The machinery has arrived for the Golden Crest 10-stamp wet crushing cyanide mill, on the head of Two Bit gulch, 5 miles southeast of Deadwood. There are fourteen tanks in the plant, of Oregon fir. It will have a capacity of fifty tons a day. Water will be supplied from the main shaft of the Golden Crest mine, 225 feet deep and filled to within 75 feet of the top with water. The ore is found in vertical veins.

The Gold Hill M. Co. is putting in a new 80 H. P. boiler at the shaft in Spearfish canyon, and when in position sinking will be resumed. Indications are that the shaft is nearing quartzite. Ore of good quality was found in the shaft when work was stopped a few weeks ago. The company will put in an air compressor and drills as soon as crosscutting begins. R. C. Patterson of Omaha, Neb., is president. There are several ore bodies on the upper horizon carrying \$6 a ton in gold.

F. Ames, superintendent the Wauconda mine at Lead, reports in a crossdrift from the shaft on the Wauconda vein seven samples covering 28 feet across the vein, with only one wall in sight, show an average of \$1 per ton.

UTAH.

BEAVER COUNTY.

G. Reynolds and J. Hamilton are sinking a double-compartment shaft on the Colossal group of twenty-three claims adjoining the Larkspur, in Beaver Lake district. They are down 30 feet and have a body of copper ore.

JUAB COUNTY.

The shaft of the Raymond mine, north of Eureka, is down 1200 feet, and will be sunk another 300 feet, says Superintendent J. C. Sullivan, and prospecting continued. It is supposed that the ore bodies of the Gemini extend north into the Raymond territory.

Superintendent J. Eustis is pushing work on the Emma Jane Con. mine, north of Eureka. The shaft is down 110 feet and sinking continues. A whim has been placed on the property. Assays show gold, silver and copper.

C. Christenson has bought a one-fourth interest in the Midgeley No. 2 claim, in the western part of Tintic district, near Eureka.

SALT LAKE COUNTY.

In November the St. Joe tunnel, near Bingham, was driven 106 feet. The shafts of the Fire King of the St. Joe group are drained by the tunnel and work will be resumed there.

Electric drills with a gasoline engine driving the generator are in operation at the properties of the Hlawatha Co. in Big Cottonwood canyon, near Salt Lake City. The tunnel is expected to cut the vein in

the next 250 feet. Ten men are at work. In the upper workings on the property ore is being opened up.

SUMMIT COUNTY.

H. C. Brownlee, manager of the St. Louis-Ontario M. Co., at Park City, says the ledge opened in a crosscut from the bottom of the shaft has been cut for 20 feet. The shaft will be sunk another 100 feet and the vein tapped at 208 feet.

TOOELE COUNTY.

The Electric M. & M. Co. has incorporated to operate in the Clifton mining district.

In the Plomo group of Stockton, of which M. Gisborn is the owner, 10 feet of manganese has been opened up in the crosscut from the 100-foot level of the incline. Gisborn is putting up a boarding house and other surface improvements.

WASHINGTON.

FERRY COUNTY.

E. R. Delbridge, superintendent the California mine at Republic, has contracted with the Hall mines smelter to handle 500 tons of California second-class ore. There will still remain 3000 tons of the same ore on the dump. The first grade ore is shipped at the rate of two carloads per week. The shaft has reached the 500-foot level and a crosscut started.

SNOHOMISH COUNTY.

Upraising to connect with the shaft has been commenced on the Bunker Hill-Sullivan. The upraise will have to be driven about 60 feet to connect, when an abundant air supply will be assured. The ore was crosscut 30 feet below.

Work is resumed on the Copper King, near Index. A crosscut is being driven to tap the ore. The ore is chalcopryite. W. Cornwall of Index is superintendent. A steel ore car has arrived for the Libby.

STEVENS COUNTY.

The Cascade Marble & Onyx Co. has incorporated; E. T. Jargenson, J. McWhir, H. F. Nather. The company owns marble properties between Addy and Colville.

Eastern men are said to be negotiating for the marble quarries 2 miles west of Northport.

Work has been resumed on the Walter Scott, near Northport.

WYOMING.

CARBON COUNTY.

The Osceola mine, in Encampment district, has been sold to the North American Copper Co. The mine was owned by Richards, Chatterton, Cosgriff Bros. of Fort Steele, J. M. Rumsey of Rawlins, F. A. Hadsell, R. E. Smiley and O. Gramm. The mine joins the Ferris-Haggerty, recently bought by the same company.

Another platinum strike is reported in the Rambler district, on the Lookout Jack claim, which has been worked by Laramie people for gold.

The North American Copper Co. is pushing work for an early spring run. On last pay day \$20,000 was paid out for labor.

At the company's mine, the Ferris-Haggerty, men are in demand, particularly laborers.

The frame of the power house at the North American C. M. Co.'s smelting plant, near Encampment, is up and the building nearly enclosed. The machinery in the concentrator is being set up.

Superintendent L. Tennant will put in an air compressor for the Moon-Anchor property near Encampment. The shaft will be sunk 200 feet more.

CROOK COUNTY.

The first carload of tin ore from the Forest City mines has been run through the crushers at Deadwood, S. D. The ore comes from the tin mines of the Bear gulch district, which have been bonded by an English syndicate. The intention is to make an experimental run of 300 tons to determine the value of the ore and the proper method of treatment.

FREMONT COUNTY.

(Special Correspondence).—The Dexter M. & Dev. Co. of Atlantic City will erect a 100-ton mill and large electric plant. This company owns 6000 acres of patented placer ground; are operating the Bryan mine and will start the mill on the Tahor Grand; ore is free milling; property is 90 miles from the railroad. D. G. Cahoon, Rochester, N. Y., is president; E. W. Sehon, Denver, Colo., consulting engineer.

SHERIDAN COUNTY.

Superintendent T. T. Tynan has sold a tract of State lands near Sheridan underlaid with coal. Two hundred acres were sold at prices ranging from \$10 to \$105 per acre. The Sheridan Fuel Co., which has mines at Dietz, was one of the principal buyers. One tract of land, containing 460 acres, was sold to Mr. Dietz of Omaha. T. Toole of Saint Joseph, Mo., bought 600 acres adjoining his mine at Minersville, 3 miles north of Sheridan.

FOREIGN.

BRITISH COLUMBIA.

Of the find of native copper on No. 1 level of the Velvet mine near Rossland, Manager W. J. Gray says: "On this level we have opened three shoots of ore, and during prospecting took out eighty-five tons of \$35 ore. The gold values run from an ounce up, with 5% to 6% copper. Ore bins are full, and shipments to the Northport smelter resumed, sending fifteen to twenty tons daily. The past month work has been confined to No. 2 level, owing to necessity of shutting down hoisting apparatus, which was transferred from a wooden to a concrete foundation. On the fifth level we have a shoot over 50 feet in length, from 3 to 5 feet wide. Recent discoveries on the first level are east of former workings. On No. 1 level of the Portland is a shoot of copper ore which will be cut by drifting from the Velvet."

A company has been formed at Rat Portage to develop a deposit of mineral paint near there.

The B. C. Co. is putting up a slag elevator at its smelter at Greenwood.

With the week ending December 19 the total ore shipments from Boundary mines for 1902 reached 483,353 tons. Boundary ore is being shipped and treated at the rate of 2000 tons daily.

It is reported the Western Fuel Co. has bought the interests of the new Tacoma Coal Co. and includes the coal hunkers and plant of J. Rosenfeld & Sons and J. C. Wilson, of San Francisco, Cal., and the Howard plant at Oakland, Cal. J. L. Howard, of Oakland, Cal., is president. The company's mines are at Nanaimo, on Vancouver Island.

General Manager E. B. Kirby, of the War Eagle and Center Star mines at Rossland, says a preliminary concentrator will be built this winter and a larger plant later, if the 2% tax is removed. The Rossland-Kootenay Co. is considering a reduction works to handle the iron sulphide ore of the property.

The second furnace of the Montreal & Boston Copper Co. smelter at Boundary Falls will be blown in in the early part of January, says Manager Goodell.

MEXICO.

COAHUILA.

J. Castellot has organized in Monterey, Nuevo Leon, the Monterey Coal Co. for the exploration and development of 50,000 acres of coal lands in northern Coahuila.

SONORA.

The foreman of the Arizona-Mexico C. Co., known as the Povedora Co., reports to W. E. Defty and W. C. Foster, officers of the company at Phoenix, Ariz., that the tunnel has been started, the cut and the tunnel being in ore. In previous preliminary work an open cut had been made in face of croppings for 35 feet. The vein is 165 feet in width. It is intended to sink a shaft near the croppings and run a tunnel from the foot wall. The property is southwest of Altar and 40 miles from the coast.

At Cananea, with eight converters in blast, the Greene Con. C. Co. is reported producing 5,000,000 pounds of copper per month.

The Prospect says a mass of native copper was taken from the Cananea mine of the Greene Con. C. Co. weighing forty pounds. It is 3½ feet long, 18 inches wide, thin and irregular in shape.

KLONDIKE.

It is reported J. J. Rutledge has been given a concession for dredging gold by the Canadian government. The grant is for the exclusive dredging privilege on Forty Mile, from its junction with the Yukon to the boundary line of Alaska and the British Yukon.

Commercial Paragraphs.

ABOUT Feb. 1, 1903, the F. W. Braun & Co.'s San Francisco, Cal., establishment will be moved from 63 First St. to their new building, 34-36 Spear St., San Francisco, Cal.

THE Independent Electric Light and Power Co., of San Francisco, Cal., has reduced its charges for motive power from the former rate of 4 to 4½ cents to a flat 3 cents per kilowatt hour, to take effect January 1, 1903.

THE Mine & Smelter Supply Co., through their New York office, have orders for two Kinkead mills and five Wilfley tables for export. The main office in Denver has purchased the entire stock and good will of the Standard Fire Brick Co. of Denver and Pueblo, Colo. The Mine & Smelter Supply Co. will handle the entire product of the above company in the assay supplies. They will now carry a complete line of assay supplies in each of their branch houses as well as in Denver.

Personal.

H. KEY is superintendent Adventure mill, Houghton, Mich.

R. GOOD is superintendent the Columbus M. Co., Salida, Colo.

J. W. LANDIS is in charge of the Maybelle mine at Gold Hill, Or.

GEO. J. BANCROFT has returned to Denver from Florence, Colo.

S. KNAPP, of Encampment, Wyoming, has returned there from Denver, Colo.

J. E. HEWSTON has returned from Searchlight, Nev., to San Francisco, Cal.

F. L. SIZER, M. E., has been examining mining properties near Helena, Montana.

R. FRAME, superintendent Smuggler-Union mill, Pandora, Colo., is in Denver, Colo.

G. T. INGERSOLL is remodeling the May Day dry concentrating mill at Tintic, Utah.

E. C. LIMBACH of Denver, Colo., is examining mines at Ocampo, Chihuahua, Mexico.

A. BUCKBEE, manager Virtue mines, Baker City, Or., has gone to Montreal, Canada.

C. R. RAY, manager Gold Hill mines, Gold Hill, Or., has gone East on mining business.

W. H. DALE succeeds J. Quinn as superintendent at the Sampson, Bingham, Utah.

J. BRUL is superintendent of the Spur Daisy mine in Eureka district, Gilpin county, Colo.

T. R. GRIFFITH, manager of the Augusta M. Co., Breckenridge, Colo., has gone to Pittston, Pa.

D. FISHER, superintendent Spagnoli mine, Jackson, Cal., is in San Francisco, Cal., to buy a new hoist.

T. FITZGERALD is superintendent the Portland M. Co., Cripple Creek, Colo., vice Mr. Garvin, resigned.

MANAGER FARNSWORTH of the Horn Silver mine has returned to Salt Lake City, Utah, from New York.

R. M. FOREE, president of the Arizona-Colorado Copper Co. at Globe, Ariz., has gone to Santa Fe, New Mexico.

J. M. LOWE, secretary of the Pitkin Gold Belt M. & R. Co., is in Gunnison, Colo., from Galveston, Texas.

R. H. MCD. HANCOCK succeeds G. P. Macker as mining engineer of the Adventure property, Houghton, Mich.

W. S. BUCKLEY, manager Ophir Con. M. & M. Co., Telluride, Colo., has returned there from Denver, Colo.

J. B. WARNER, manager Ledge M. & M. Co., Red Mountain, Colo., has returned there from Denver, Colo.

EMERSON GEE, manager California King G. M. Co., Pichacho, Cal., has returned there from Denver, Colo.

SUPERINTENDENT HARMON of the Penn Chemical Co., Campo Seco, Calaveras county, Cal., has gone East.

MANAGER WINSLOW and SUPERINTENDENT CHASE of the Liberty Bell mine Telluride, Colo., are in Denver, Colo.

T. L. ODDIE has been elected general manager and H. C. West superintendent Tonopah Fraction M. Co. at Butler, Nev.

GENERAL MANAGER D. MCVICHE of the Bingham Consolidated M. Co., of Bingham, Utah, has returned from Boston.

E. M. JOHNSON, chief chemist Grant plant, Denver, Colo., has resigned, to accept a position as manager of a smelter at Iola, Kans.

SUPERINTENDENT NATHAN of the Emma M. & M. Co. at Dunton, Dolores county, Colo., has returned there from Denver, Colo.

SUPERINTENDENT C. J. GARVIN of the Portland G. M. Co., Cripple Creek, Colo., has resigned to operate leases on his own account.

J. A. DIGGLES, metallurgist, and R. N. Diggles, assayer, for the Melones M. Co., Melones, Calaveras county, Cal., are in San Francisco, Cal.

T. A. PATESON, JR., superintendent American Hill mine, near Forest City, Sierra county, Cal., has gone to New York for a few months.

W. H. DAVIS, Supt. Smuggler-Union mill, Telluride, Colo., has returned to Boulder, Colo., until such time as the mill will resume operations.

F. CHAPPELET, JR., superintendent Mohican mine, near Groveland, Tuolumne county, Cal., has returned to the mine from Oakland and San Francisco, Cal.

L. C. JACKLING, manager of the United States S. & R. Co. of Canyon City, Colo., and D. M. Gray, ore buyer for the company, have been inspecting Leadville, Colo., district.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING DECEMBER 16, 1902.

715,735.—COIN APPARATUS—Albert & Wiggins, Salem, Or.
715,938.—FONT OF TYPE—J. H. Ames, Portland, Or.
715,938.—LIFE PRESERVER—J. E. Armstrong, Santa Cruz, Cal.
715,939.—LOG RAFT—J. Ayres, Portland, Or.
715,972.—TRANSP. RING APPARATUS—C. H. Butler, O. K. and, Cal.
716,205.—CONCENTRATING TABLE—W. G. Dodd, S. F.
716,029.—BUILDING CONSTRUCTION—S. Giletti, S. F.
716,030.—NAIL MAKING MACHINE—J. H. Goetsche, S. F.
715,783.—FRUIT PEELER—L. F. Graham, San Jose, Cal.
716,356.—VALVE—T. R. Green, Anaheim, Cal.
715,929.—GARBMENT CLEANER—W. Harbough, Santa Barbara, Cal.
716,043.—LAMP M. S. Hufschmidt, S. F.
716,246.—EXCAVATOR—A. Klatt, Collinsville, Cal.
715,823.—FRANZIS—A. Leitz, S. F.
716,031.—FRUIT—S. W. Luitwiler, Los Angeles, Cal.
716,053.—COMPOUND—M. McWhorter, Milton, Cal.
716,077.—HANDLE SOCKET—T. Mottin, S. F.
715,848.—PENCIL SHARPENER—D. F. Oliver, Fruitvale, Cal.
715,849.—PENCIL SHARPENER—D. F. Oliver, Fruitvale, Cal.
715,851.—DRILL COUPLING—L. C. Preston, West, Or.
716,111.—CAN BODY MACHINE—Ross & Wachhorst, S. F.
716,131.—OIL BURNER—C. W. S'evert, Los Angeles, Cal.
715,990.—SIGNATURE GATHERER—D. M. Smyth, Pasadena, Cal.
716,149.—CLEARING—F. Steinkamp, Bethany, Cal.
716,149.—STEP LADDER—M. E. Trafton, Los Angeles, Cal.
716,320.—TELEPHONE—R. I. Willmarth, S. F.
715,923.—PRINTING FRAME—W. G. Wood, S. F.
715,926.—SHOW CASE—O. Yates, Portland, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONVEYING APPARATUS—No. 715,471. Dec. 9, 1902. F. R. French, San Francisco, Cal. This invention relates to improvements in transportation systems whereby it is desired to convey by means of suspended cables a burden in either a longitudinal, transverse or vertical direction in relation to a certain surface area. It consists of suspended cables, a burden carrier adapted to be supported upon and to be moved by said cables, independent fall lines whereby the burden may be deposited or taken up at any point, means for supporting said fall lines, and means for operating said lines and cables. There is also an automatic discharge device between the fall rope and the load whereby the load is discharged by the movements of the rope.

BUILDING CONSTRUCTION.—No. 716,029. Dec. 16, 1902. Secondo Giletti, San Francisco, Cal. The object of this invention is to devise a form of construction in which the walls shall go up story by story in advance of the metal framework that is to bind the whole into a rigid structure. It comprises tubular blocks laid in courses, so as to have their openings disposed to form a series of vertical flues; metal columns are inserted at intervals in these flues with anchor plates to which these columns are secured, and means are provided upon these columns which project beyond the interior wall surface by which the floor and ceiling girders may be supported. The other details of construction, the whole forming an improvement in wall and partition construction and girder supports in buildings of combination stone or brick and steel.

LIFE PRESERVERS.—No. 715,938. Dec. 16, 1902. J. E. Armstrong, Santa Cruz, Cal. This invention consists of an arrangement of floats and connections by which they are applied to the body in such a manner that the body is automatically positioned and turned with the face upward, and the head and face so supported that the latter is above the surface of the water, and the person is prevented from being strangled or drowned.

FONTS OF TYPE.—No. 715,936. Dec. 16, 1902. J. F. Ames, Portland, Or. This invention consists of an improved font of type having independent 'codies, each having a character on one end, said 'codies having opposite sides corrugated continuously from top to bottom in parallel transverse lines extending from edge to edge of the body, and with the corrugations of adjacent bodies adapted to interlock throughout the height of the bodies, each of said bodies having a channel formed in one edge parallel with the character-bearing face, and at right angles to the corrugations.

TRANSPORTING AND DISTRIBUTING APPARATUS.—No. 715,972. Dec. 16, 1902. C. H. Butler, O. K. and, Cal. This invention relates to an apparatus which is designed for the purpose of transporting goods, such as grain or other products in sacks, from a source of supply, such as a vessel, and distributing them at various points throughout a warehouse or other place of storage. The object of the invention is to dispense with the trucks and with all but a few of the men needed for piling the grain. This is effected by the construction of a trough or surface A, extending through the warehouse or other point of deposit at such an elevation as to be substantially above the highest point to which the sacks are to be piled. This trough or surface may extend through the center, if the building be wide, or near one side, or in very wide buildings a plurality of these surfaces may be provided.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine hydraulic process from Frank Mining Co., in Sailor Flat Hydraulic Mine, near Nevada City, Nevada County, Cal., draining into Sailor Flat Creek which reaches South Yuba River; from A. A. Goodman and A. C. Kinnear, in Sage Hill Mine, near Michigan Bluff, Placer County, Cal., draining into Skunk Creek, which reaches Middle Fork of American River; from Frank Joseph, in Frank Joseph Mine, near Watson Gulch, Shasta County, draining into Roaring River which reaches Sacramento River; and from Alfred Dixon, et al., in Big Gun Gold Mine, near Michigan Bluff, Placer County, Cal., draining into Poor Man's Creek which reaches American River, gives notice that a meeting will be held at Room 96, Flood Building, San Francisco, Cal., Dec. 29, 1902, at 1:30 P. M.

Latest Market Reports.

SAN FRANCISCO, Dec. 24, 1902.

METALS.

SILVER.—Per oz., Troy: London, 22½d (standard ounce, 925 fine); New York, bar silver, 48½c, refined (1000 fine); San Francisco, 48½c; Mexican dollars, 38 @ 39c San Francisco, 38c New York.

No material change in silver within the past week, fluctuations being too small to deserve notice.

COPPER.—New York: Standard, \$10.75; Lake, 1 to 3 casks, \$11.65; carload lots, \$11.30; Electrolytic, 1 to 3 casks, \$11.45; carload lots, \$11.25; Casting, 1 to 3 casks, \$11.35; carload lots, \$11.10. San Francisco: \$14.00. Mill copper plates, \$17.00; bars, 18@24c. London: \$51 7s 6d spot per ton.

LEAD.—New York, \$4.12½; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco, \$4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London: \$10 16s 3d per ton.

SPELTER.—New York, \$4.80; St. Louis, \$4.50; London, \$19 17s 6d per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

ANTIMONY.—New York, Cookson's, 9½c; Hallett's, 8½c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

TIN.—New York, pig, \$25.95@26 00; San Francisco, ton lots, 27c; 500 lbs., 27c; 200 lbs., 27½c; less, 28c; bar tin, \$32.50. London, \$117 15s spot.

PLATINUM.—San Francisco, crude, \$18.00 per oz.; New York, ingot, \$19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, \$45 50@46 50; large lots; London, \$3 15s; San Francisco, local, \$46.00 per flask of 7½ lbs.; Denver, \$49.50. Export, \$43.50.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34½.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.10c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, \$24 25; gray forge, \$21.15; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$28.00@30.00; open hearth billets, \$32@34 00; San Francisco, bar, 7c to 12c per lb.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less

than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10½c per set; 14 oz., 40s., 9½c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 25@26c per lb.; carloads, 24@24½c; in 10-lb. tins, 35c; sulphuric acid, in carboys, 66½ B, 2c per lb.; soda ash, \$2.00 per 100 lbs.; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chloride of potash, 12@13c; roll sulphur, 3c; alum, \$2.00@2.25; flour sulphur, French, 3½@3¾c; California refined, 2@2½c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.25 @1.50 per 100 lbs.; ska, \$1.05; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in bbls., 8c; caustic potash, 10c in 40-lb. tins; sulphide of iron, 9c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, \$8.50; Seattle, \$6.50; Coos Bay, \$5.50; Southfield, \$8.00. Cargo lots, Eastern and foreign: Wallsend, \$6.50; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.00; Welsh Anthracite, \$13.00; Rock Springs, \$8.50, long ton; Colorado Anthracite, \$14.00. Coke, \$10.50 per ton in bulk, \$13 in sacks; Sunnyside, \$8 50, long ton.

OILS.—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; lots of 5 bbls., 1c less; Lucol oil, boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 22½c; Astral, 22½c; Star, 22½c; Extra Star, 24c; Eocene, 23½c; Elaine, 26½c; Water White, in bulk, 16c; Mineral Seal, iron bbls., 18c; wooden bbls., 20c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 17c; do. cs., 23½c; 56° Gasoline, bulk, 21c; do. cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do. in cs., 22½c; Lard Oil, No. 1 bbl., 95c; cs., \$1.00; Neatsfoot Oil, bbl., 70c; cs., 75c; No. 1 bbl., 55@57½c; cs., 57½@60c; Sperm, crude, 50@60c; Natural White, 65c; Bleached do, 70c; Whale Oil, cs., 50@55c.

WHITE LEAD.—Per lb., in kegs: Five tons and over at one purchase, per lb., 6c; 1 ton and less than 5 tons, per lb., 6½c; 500 lbs. and less than 1 ton, per lb., 7c; less than 500 lbs., per lb., 7½c; in 25-lb. tin pails, 1c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, 2½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD AND LITHARGE.—One ton and over at one purchase, per lb., 6c; 500 lbs. and less than 1 ton, per lb., 6½c; less than 500 lbs., 7c.

ASSAY LITHARGE.—Per lb., 8½c. BISMUTH.—Subnitrate, per lb., \$1.60. BONE ASH.—4c per lb.

BORAX.—Crystal, 7c; calcined, 25c.

CHROMIUM.—(90% and over) per lb., \$1.25.

COPPER.—Carbonate, 20c; Red oxide, 30c, 60c.

MANGANESE.—(90% and over) per lb., \$1.25.

MERCURY.—Bichloride, per lb., 90c.

MOLYBDENUM.—25c. per gramme; 1000 grammes—2½ lbs.

PHOSPHORUS.—(American) per lb., 80c.

SILVER.—Chloride, per oz., 75c; nitrate, 55c.

SODIUM.—Metal, per lb., \$1.00.

URANIUM.—Oxide, per lb., \$3.50.

ZINC.—Metallic, chemically pure, per lb., 50c.

ZINC.—Dust, per lb., 10c.

ZINC.—Sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

Wanted, position as assayer or assistant, Jan. 1st. References. Address Box 18, this office.

Superintendent, competent assayer, chemist and surveyor, experienced in development work, wishes position in any capacity. "Seattle," this office.

Cyanide man and assayer wants position. Can take shift on mill if needed. Practical experience and reliable. C. F., Mining and Scientific Press.

A sober, industrious young man desires a situation as surveyor, assayer, draughtsman and bookkeeper. Has had three years' technical training and three years' practical experience in gold and quicksilver. Am conversant with the estimation of ore and the preparation of maps and reports. Best of references as to ability and character. Address "M," care of Mining and Scientific Press.

An energetic young man, thoroughly conversant with the indications, occurrence, mining and reduction of quicksilver ores, wishes a situation as superintendent of a quicksilver property. Technically trained. Can handle men to advantage and am thoroughly acquainted with the duties of the office. All references as to character and ability. Address "Quicksilver," care of this office.

Engineer at present in field will be open for engagement Feb. 1st. Will engage with substantial people by the year as manager, superintendent or engineer, or, if field is open, for lesser position, subject to advance upon results obtained. Thorough in technic and practice. Successful with men. Credentials the best. Address E. D. B., this office.

Competent and reliable technically educated man, 34 years of age, desires position with a good mining company. Has had wide experience in the handling of low-grade gold ores where economy was essential to success. Can give best of references. Address L. D. H., care Mining and Scientific Press.

Competent Millman, Machinist and Chemist. Experience free mill and concentrating. College education. Have built and operated mills in Montana for 13 years. Competent accountant and able to administer affairs of a company. Would like situation with a company out of a promoter's hands. References the best. Address H., care this office.

Wanted, position as mill superintendent or foreman of an amalgamation and concentration mill; have had 18 years' experience; am a good machinist and understand handling all kinds of machinery; can furnish best of references; at the present time hold the position of superintendent for one of the largest companies in the State of Colorado, but wish to change and will go to any country. Address H. D., care of Mining and Scientific Press.

DIVIDEND NOTICE.

San Francisco, Dec. 23, 1902.
To the Stockholders of the Jamison Mining Co.—At a meeting of the Board of Directors of the Jamison Mining Company held this day, a dividend of \$11.700, being three cents per share on all the Capital Stock of the Company, was declared payable at the office of the Company, 620 Howard Building, San Francisco, Cal., on Monday, January 19, 1903.

Payment will be made to the Stockholders on personal application or on duly signed order presented at the office of the Company, or checks will be mailed in accordance with proper instructions and order addressed to the Secretary.

Transfer books will be closed at 12 o'clock noon on Saturday, January 17, and reopened at 9 o'clock A. M. on Tuesday, January 20, 1903.

SAM. W. CHEYNEY, Secretary.

SIX YEARS' CONSTANT WEAR WITHOUT A BREAK.

1700 BELTS IN USE.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

We have been using your "Patent Lip" flange belt on our "Triumph" Concentrators since May, 1895, and find that they have given better wear than any other belt made. Also the twelve 6-foot Frues with "Patent Lip" flange belts, lately put in here, are giving us every satisfaction. Yours truly,

THE EMPIRE MINES,
GRASS VALLEY, NEVADA CO., CAL., Jan. 29, 1901.

G. W. STARR, Managing Director.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

The eight "Patent Lip" flange belts purchased from you in December, 1895, have been in constant use in the mill since that time, and have given the best of satisfaction, and have proved to be far superior to the old plain flange belt which we were using. The belts now in use show hardly any wear, and seem to be in as good condition as when first put on the machines; one thing, they do not show any tendency to crack along the edge of the belt.

Yours truly,

PIONEER-LYNN MINING COMPANY,
TOWLE, PLACER CO., CAL., Jan. 12, 1901.

JERRY SULLIVAN, Superintendent.

Air Lift Pumping Plants,
Water Wheels.

Standard Diamond Rock Drills.

We are in a Position to Furnish Estimates on the Machinery and Erection of Complete Plants.
Write us for Catalogues and Prices.

HARRON, RICKARD & McCONE,
21-23 FREMONT STREET, SAN FRANCISCO, CAL.

INDEX TO VOLUME LXXXV

OF THE

Mining and Scientific Press

FROM JULY TO DECEMBER, 1902

A

	PAGE.
Abandonment of Mining Claim.....	292
Abbe Engineering Co.....	260
Abrasive Material.....	292
*Absorbent Roller.....	61
Absorption of Joplin, Mo., Properties.....	87
Of Public Lands.....	321
Accidents in Mining, First Aid.....	146
Avoided in Mines.....	364
Acetate of Zinc.....	265
Acetic Acid Diluted.....	306
*Acetylene Gas Generator.....	284
Gas.....	45
Acids and Zinc Smelters.....	85
*Actuating Mechanism for Jigs for Washing Ores.....	224
Adams, W. J.....	62
Adaptability of Wire Rope Transportation.....	248
Advance of Gold Dredging.....	172
In Mining and Metallurgy.....	277
Advertisers and Subscribers.....	321
"Advertising Out" Co-owner.....	338
Literature Standardized.....	83
Mines.....	71
Africa Barren of Silver.....	217
Africa's Principal Mineral Region.....	365
Aggregate Gold Yield of California.....	32
Aid to the Injured in Mine Accidents.....	146
Ainsworth, Wm., & Sons.....	116
*Air Compressor.....	37
Compressing Apparatus.....	192
Compression, Comparative Cost of.....	148
Compressor at Different Altitudes.....	20, 100, 173, 233, 306
Compressor, Duty of.....	142, 264, 278, 306, 325
Compressor Lubrication.....	336
Compressors, Automatically Controlled.....	351
Cylinder Capacity.....	306
Drills, Working Pressure of.....	336
Drying for Blast Furnaces.....	357
For Pump Interheated.....	188
Pressure.....	3, 173, 217
Pressure, Loss of.....	306
Pump.....	103
Pump Direct Connected.....	20
Required for Coal Combustion.....	351
Required for Drilling Machines.....	173
Temperature at Different Altitudes.....	217, 233
Altchelon, Rolt, Perforated Metal Co.....	139
*Ajax Mine, Victor, Colo.....	60, 35
Alabama Mines.....	11
Alabandite.....	351
Aladdin Reading Lens.....	35
Alaska Mines.....	11, 38, 52, 64, 77, 92, 106, 119, 134, 152, 166, 194, 225, 241, 256, 272, 285, 299, 315, 339, 343, 356, 372
Alaska-Treadwell Operations.....	20, 25
Alcohol's Effect on Metals.....	32
Alkalinity of Cyanide Solutions.....	142
Alis-Chalmers Co.....	15, 42, 66, 110, 111, 123, 128, 139
Alloyed Steel Annealing.....	276
Alloy That Expands When Cooling.....	32
Alloy for Steam Fittings.....	336
Of Good Tensile Strength.....	336
Resembling Gold.....	233
Alloys of Aluminum.....	217
Of Alkali Metals.....	193
Of Copper and Silver.....	113
Almaden Quiksilver Mines.....	216
Altitude and Air Temperature.....	217
Of California and Colorado Mines.....	332
Altitude's Effect on Air Compressors.....	20, 100, 173
Aluminum.....	112
Alloy.....	217
Coating With Other Metals.....	233
Lubricant for.....	202
Soldier.....	56
Aluminum's Present Use.....	165
*Amalgam Trap.....	292
Gold In.....	292
Plateau Sweated.....	332
*Amalgamating Metals.....	132
A Copper Plate.....	142, 219
Pao, Evolution of.....	176
Plates, How Cleaned.....	306
Amalgamation and Extraction.....	217, 336, 354
And Temperature of Water.....	216, 306
Methods, Avoiding Loss of Mercury.....	356, 366
Of Silver Ores.....	56
With Vaporized Quicksilver.....	113
*Amalgamator.....	25
Amending Mining Law.....	16
American Chemical Society.....	185
Engineering Works.....	97, 123, 296, 316, 364
Institute Electrical Engineers.....	193
Institute Mining Engineers.....	126, 206
Mining Congress.....	263
Smelting & Refining Co.....	7, 6, 13, 170, 172, 216, 276, 282
Standard Boiler H. P.....	29, 97, 394
Steel & Wire Co.....	29, 97, 394
America's Supremacy in Electrical Field.....	20
Ammonia Sulphate of Copper, How Made.....	3
Ancient California River Beds.....	200
Ophiolite Site of.....	370
River Channel.....	133, 200
Aneroid Barometer.....	173
Angels, Cal., Railroad.....	276
Annealing Alloyed Steel.....	128
Annual Output of Lead.....	32
Anode Residue Treatment.....	284
Antidote to Arsenical Poisoning.....	202
For Cyanide Poisoning.....	3
For Lead Poisoning.....	56, 100
Antimony.....	56, 100
Antiquity of Assaying.....	56
*Antiseptic Telephone Mouthpiece.....	117
Apex and Side Lines.....	113
What It Is.....	217
*Apparatus for Exposing Beds of Watercourses and Conveying Material Therefrom.....	234
For Concentrating Magnetic Iron Ores.....	37
For Electrolytic Treatment of Ores or Silices.....	91
For Extracting Metals From Ores.....	149
For Leaching Ores.....	91
For Making Blue Prints by Electric Light.....	202

*This mark indicates that the article indexed is illustrated.

	PAGE.
*For Obtaining Metals by Electrolysis.....	357
*For Oil Ore Separation.....	25
*For Producing White Lead.....	206
*For Recovering Minerals Carried Off in the Fumes of Smelting Furnaces.....	37
*For Roasting Ores.....	314
*For Separating Metals From Their Ores.....	165
*For Separating Ores.....	91
*For Thawing Frozen Ground.....	180
*For Treating Pulverized Ores of Gold or Silver.....	192
*For Use in Extracting Precious Metals From Their Ores.....	240
Appeal From Land Office Rulings.....	322
Application of Geology to Mining.....	145
Approximate Value Gold Specimens in Quartz.....	322
Arbitration.....	30, 323
Arc Lamps.....	113
Argentine, Richest of Silver Ores.....	142
Arid Lands of the United States.....	180
Arizona Freight Rates to Texas.....	84
Mines.....	26, 33, 52, 64, 77, 92, 106, 119, 134, 150, 165, 173, 194, 203, 225, 256, 272, 285, 299, 315, 329, 343, 358, 372
Statehood.....	2
Arrests.....	217
Arsenic in Quicksilver Ore Assay.....	264
*Recovery of From Ores and Metallurgical By-products.....	131
Arsenates in Roasting.....	232
Arsenic Poisoning, Antidotes to.....	280
Arthur, C. W.....	280
*Art of Blasting.....	255
Asbestos Filter Free of Duty.....	64
Found in Serpentine.....	233
Mines of Canada.....	46
Ash in Steam Coal.....	306
Ashe from Coal.....	173
Asphalt-Coated Flumes.....	264
Assay of Copper Materials for Gold and Silver.....	71
How to Get Correct.....	157
Melt With Carbon Therein.....	306
Of Cyanide Solutions.....	218
Ton.....	322
Ton System.....	233
*Assayer's Furnace.....	235
Certificates.....	232
Assaying Copper Ores and Products.....	4, 24
*And Melting With Oil Furnaces.....	49
Antiquity of.....	49
Cyanide Solution.....	56
Gold for Coining Purposes.....	219
Gold or Silver at U. S. Mint.....	71
Notes on.....	337
Of Chalcopyrite.....	173
Quicksilver Ore.....	364
Sulphide Ores.....	113
Zinc Precipitates.....	32, 186
Assays Unaffected by Altitude.....	45
And Mill Tests.....	217
Assessment on Option.....	185
Work for 1903.....	335, 363
Wagon, 24, 45, 84, 113, 142, 157, 185, 217, 216, 249, 296, 311, 333, 351	
Assouan, Egypt, Dam.....	350
Atlas Car & Manufacturing Co.....	303
*Atmospheric Products.....	98
Air, Weight of.....	249
*Attachment for Hydraulic Nozzles.....	165
Austin, F. C., Manufacturing Co.....	82
Australia a Producer and Seller of Silver.....	110, 171, 174, 213, 347
Australian Mines.....	110, 171, 174, 213, 347
Mine Department Report.....	63
Mine Salaries.....	51
Austrian Mines.....	122, 244
Authority for Statements in This Paper.....	3
*Automatic Dumping Device.....	74
*Bucket Dumping Mechanism.....	314
Control of Air Compressors.....	351
*Dumping Frame for Shaft.....	313
*Stop and Lock for Oil Well Casing.....	133
*Water Motor.....	86
Average Elevation of New Mexican Mining Camps.....	71
Avoiding Accidents in Mines.....	364
Loss of Mercury in Amalgamation.....	356, 366
Avoldupols and Troy Weight Compared.....	322

B

Bahilit Metal.....	20
"Baby" Drill.....	365
Back Numbers of This Paper, Price of.....	233
Balcomb, J. B.....	130
Band Saw, Tension of.....	142
Bank Cannot be Corporation Treasurer.....	113
Bar for Tension Test.....	322
Barium Dioxide in Cyaniding.....	279
Sulphate.....	249
Bark, Removal of From Mine Timbers.....	142
Barometer, Aneroid or Holsterio.....	264
Barometric Measurement of Height Differences.....	142
"Barrel of Copper," What It Means.....	249
Copper.....	217
Barrels, Measurement of.....	3
Bartlett, C. O., & Snow Co.....	55, 275
Battery Renewals of Sal-ammoniac.....	173
For Primary Electrical Action.....	217
Plates, How Cleaned.....	306
Sample Assay.....	157
Water Heated.....	351
Baume °, What It Means.....	217
Bay Counties Co.'s Power Lines' Capacity.....	64
*Belcher and Red Rock Mines.....	336
*Belshaw, C. M.....	311
Belt Friction and Pressure.....	202
Power Transmission.....	202
Belt, How to Put On.....	249
Bell Line, Location of, in Shaft.....	365
Bending Pipes.....	113
Bennett, S. G.....	6
Best Manufacturing Co.....	303, 325
Bettels Process.....	292
Betty Process.....	292
Bigelow, D. E.....	156, 347
Bins for Ore.....	351
Bismuth Precipitated Quantitatively.....	233
Silver Alloy.....	128
Black Sand, Iron From.....	265
*Blast Furnace Building, Washoe Co., Butte, Montana.....	140
Furnace.....	357
Furnace Gas in Gas Engines.....	105
Furnace Practice for Iron Ore.....	157
*Blasting Fuse.....	314
By Knox System.....	365
Tough Rock.....	365
Blende 1% Sulphur.....	20
Blowpipe Analysis.....	64
Blow Pipe Gas in Gas Engines.....	105
Blue Mountain Forest Reserve.....	236
Blue Printing by Electric Light.....	45
Paper, How Made.....	142
Prints, How Made by Electric Light.....	202, 232
Prints, How Turned Brown.....	202
Prints, How Waterproofed.....	84, 100
*Boilers and Boilers.....	254
Boiler Expansion and Contraction.....	173

Explosions From Low Water, How Prevented.....	100
Firing With Oil.....	7, 24, 36
Horse Power.....	142, 157
How to be Treated When Laid Up.....	249
*Internally Fired.....	117
Scale Prevention.....	58, 83
Setting of Shafts.....	323
*Solvents, How Introduced.....	254
Steam Pressure.....	278
Testing.....	100
Water Put in, Without Pumping.....	365
Water Requirements of.....	336
When Good and Economical.....	20, 351
Why It Explodes.....	45
Boilers, Effect of Oil Fuel Thereon.....	28
Bolts in Stone-work, How Fixed.....	249
*Bon Air Shaft, Leadville, Colo.....	356
Bonding Mine Property.....	99
Bonnets of Valves.....	202
Book Notices.....	16, 155, 213, 260, 289, 318, 363
Books and Serials.....	31
Borax, Production of.....	110
Borneo Mines.....	132
Bornite.....	132
Bose, M. P.....	74
*Bosworth Crusher.....	76
Boulders, How Broken.....	345
Bounty on Lead Production in Canada.....	126
*Box Electric Rock Drill.....	320
*Mortar in Stamp Mills.....	239, 334, 362
Braun, W. V.....	239, 334, 362
Breaking Strain of Manila Rope.....	202
Brent, Chas.....	49
*Briquetting, How It Is Done.....	21, 155
Ore Dust.....	306
*Plant, Washoe Co., Butte, Montana.....	140
British Columbia's Proposed Arbitration.....	36
Lead Conditions.....	176
Mine Taxation.....	112
Mines.....	14, 29, 40, 55, 67, 81, 96, 110, 122, 138, 153, 154, 169, 182, 198, 213, 228, 241, 258, 259, 275, 288, 302, 318, 332, 347, 361, 375
Mining Claim.....	332
Mining Conditions.....	201
Broderick & Bascom Rope Co.....	319
Broken Creek Shaft.....	125
Broken Hill Proprietary Co.'s Report.....	125
Bromine Process Gold Extraction.....	142
Brown-Corliss Engine Co.....	275
Brown, R. S.....	338
Brushing Battery Plates.....	306
*Bucket Dumping Device.....	74
Dredging.....	310
Dumping Mechanism.....	314, 342
*Buffer Device for Rock Drills.....	271
Buttington, J. M.....	289
*Building Dams.....	37
*For California University Mining College.....	304
*Subaqueous Foundations.....	118
